RAJ-GURU, or Raj-gur, is the priest, tutor, or preceptor, of a rajah; but the term is applied in Kattywar, to the domestic brahmin of any family. The Katt'hi and even every individual of a hindu caste has a Raj-gur. In the peninsula, of Guzerat and Kutch, the Raj-gur form a distinct tribe."—*Cormack's Female Infanticide*, p. 25.

RAJHATH, also called Jeypore, a town in the Burdwan district of Bengal.

RAJIKA, also, Tsjettipullu. SANS. Eleusine coracana. *Gært. Natchenny*.

RAJIKA. BENG. *Sinapis ramosa*.

RAJIVANARU, also Rajiavaru. TEL. Sudra hindoo; armed peons in Mysore, also a class of people in Kamaon speaking Telugu.

RAJIN. A convert from the Bhatti, cultivators, shepherds, thieves and evil livers.

RAJ JOGI, is the chief of the ascetic warriors of Mewar; the mahunts are commanders.

RAJKOT, L. 22° 13'; L. 71° 7', in-Gujerat, 150 miles W. of Baroda.

RAJKUMAR, a numerous and wealthy agricultural race in the N. W. Provinces, long notorious for the murder of their infant daughters. They claim descent from Prithi-raj in whom ended, about the early part of the eleventh century the Chauhan dynasty of the princes of Delhi, and from whose stock the present race of the Raj-Kumar (who then also assumed this new family denomination) is believed to be sprung. Their number, it is said, does not exceed forty thousand, most of whom inhabit the N. W. Provinces in nearly one society. They are origina-

ally Raja-Putra, offspring of the royal race : and even excoed the whole of the rajput races in the wildness of their notions and peculiarity of their manners.—*Cormack. Hindu Infanticide*, pp. 1 and 2. *Wils. Gloss.*

RAJMAHAL HILLS rise about 20 miles S. of the Ganges, stretch S. and S. W. to the Vindhya range and the high lands of the Deccan. They terminate at the pass of Sikrigali. They traverse the district of Behar. They are of moderate elevation. There is a cluster of hills on the W. of the Phulgu, one on the E. of that river, a third near Shukpoora 100 feet, but the hills towards the south are probably twice that elevation. The railway sweeps round the eastern extremity of the range. The Rajmahal hills form a kind of knot at the extreme eastern point of the hill country of Central India dividing Bengal from Behar. Dr. Oldham has shown that the group of rocks of the Rajmahal hills constitute a formation quite distinct from that of the coal-bearing beds of Burdwan and some other localities; to which latter group he applies the name of the Damuda beds. He shows that the fossil vegetation of the two formations is entirely different both specifically and in general aspect; that not one species is common to the two; that the Rajmahal beds are characterized by a remarkable abundance and variety of cycadæ, by a comparative paucity of ferns, and by the absence, in particular, of the genus *Glossopteris*, as well as of *Phyllatheca* and *Vertebraria*; while the Burdwan or Damoodah beds are characterized especially by *Glossopteris*, *Phyllatheca*, and *Vertebraria*, with scarcely a trace of Cycads. The Nagpur fossil flora agrees altogether in this respect with that of the Damudah, and not with that of the Rajmahal formation. Dr. Oldham is of opinion that the Rajmahal beds are mesozoic, and probably jurassic, the Damoodah beds palæozoic, and that the facies of this Nagpur and Burdwan flora is rather mesozoic. But Mr. Hislop thinks the palæo-botanical evidence is far from unequivocal, and, such as it is, might be outweighed by the discovery of a single well-marked and thoroughly characteristic fish, shell, or coral.

The Rājmahal people are known as Male. They are to the east of the Oraon, but are entirely different from their neighbours the Sonthal. They are better looking than the Sonthal. The skin is dark, face broad, eye small, and lips thicker than those of the men of the plains. Their language abounds in terms common to the Tamil and Telugu, and contains so many Dravidian roots of primary importance, though it also contains a large admixture of roots and forms belonging to the Kol dialects, that Dr. Caldwell considers it had originally belonged to

the Dravidian family of languages. A bris vocabulary of the words of the tribe inhabiting the Rajmahal hills in Central India, is contained in Vol. V. of the Asiatic Researches, and Mr. Hodgson's more complete collections prove the idiom of this tribe to be in the main Dravidian. Test words show an identity of language among the Rajmahali on the east and the Maria Gond in the remote jungles down to the Godavery, and the Gond who live along the Satpura as far west as Nimar and Malwa. It is akin to that of the Oraon. Latham says Berdo is one of their gods, and is the same as the Batho of the Bodo, the Potlang of the Kuki and Buddha, and their priesthood, like that of the Bodo, consists of devian and devasi: It was the Male race, amongst whom Mr. Cleveland so successfully laboured to impart to them settled habits. They have been successfully reclaimed, are quiet cultivators, and formed the bulk of the corps known as the Bhagulpore hill ranges. Ghatwall estates are particularly numerous in the Bhagulpur and Bherbhun districts adjoining the Rajmahal hills on either side. Such estates pay no revenue, but are held on the condition of guarding the passes against hill robbers, murderers and cattle-lifters.—*Latham. Quarterly Journal of Geological Society*, Vol. XVII, August 1861, p. 346. See Dravidian; India.

RAJ-MALA or Chronicles of Tripura. A Bengali poem.

RAJPIPLA is a range of hills near Cambay, in which occur agate, onyx, cornelian, and bloodstone, but called Cambay stones from the place where they are mostly cut, and from which they are almost wholly brought to Bombay. The cornelian is found in a bed of blue clay—the detritus, probably, of the adjoining rocks. Shafts are pierced in this to the depth of from thirty to thirty-five feet, and horizontal galleries run in any direction that suits the fancy of the miner: the pebbles are distributed promiscuously, and do not appear to lie in veins or lodes. The galleries seldom exceed a hundred yards in length,—they often run into those of other mines: they are generally five feet in height, and four across. To each mine there are thirteen men attached, who work by turns. Each man must send up so many basketsful of earth and stones before he is relieved. The stones are collected in baskets and drawn up by a rope run over a roller or pulley. A group of people await them at the mouth of the shaft, and examine them one after another by chipping each on a piece of stone: the compact and fine-grained are the best, and the blacker the hue is at first, the redder it becomes after being burnt. There were, in 1852, about one thousand miners employed; and each man carried home with him a basket of stones every

evening. They were spread out on the ground and for a whole year turned over every four or five days to the sun; the longer they are so exposed the richer become their tints. In the month of May they are burnt. This operation is effected by placing the stones in black earthen pots or chatties. The pots are placed mouth under, a hole being pierced in the bottom of each; over this is put a piece of broken pot. The pots are arranged in single rows; sheeps' dung is the only fuel found to answer; the fire is always lighted at sunset and allowed to burn till sunrise. If any white spot appear on the surface of the pot, the burning is reckoned incomplete, and the fire continued some time longer. On being removed, the stones that have flaws are thrown aside as useless; those not sufficiently burnt are kept for next year's burning, and the remainder are sold for exportation. Nearly the whole of the stones are cut at Cambay—the greater part of them are made into beads. In the process, the stones are first broken up into pieces of suitable size for the end they are desired to serve. An iron spike is stuck into the ground, point upwards: the stone is placed on this and chipped with a hammer till nearly rounded: it is then passed on to the polisher, who seizes it in a pair of wooden clams and rubs it against a piece of sandstone placed in an inclined plane before him, turning it round from time to time till it assumes a globular form. It is then passed on to the borer and polisher: a hole is drilled. Cambay enjoys celebrity for its agates, mocha-stones, cornelians, and all the chalcedonic and onyx family, all of them brought from Rajpipla, but worked up at Cambay into every variety of ornament,—cups, boxes, necklaces, handles of daggers of knives and forks, seals, &c. "Cambay stones," the akeek of the natives of Bombay, and by Europeans called agates, include all kinds of quartz minerals. They are also obtained from the amygdaloid trap rocks drained by the Ner-budda and Taptee. They pass in Europe and America for Scotch, Irish, Chamounix, Niagara, and Isle of Wight "pebbles," according to the place in which they are sold. The principle varieties sold in Bombay are crystal, milk quartz, prase, a great variety of moss stones, mocha stone, fortification agate, chalcedony, cornelian, chrysoprase, heliotrope, onyx, obsidian, and very rarely amethyst. These stones however abound in all trap countries, the Brazils importing them as largely as India into Europe, where the terms Brazilian and Indian agates are used indifferently by the trade.

RAJPUTANAH stretches from L. 23° 15' to 30° N., and from L. 69° 30' to 78° 15' E., and containing an area of 123,000 square miles, with a population estimated at ten millions miles, and includes eighteen principalities, viz.:—

Mewar or Oodleypur.	Rajpoot.	Jeysulmeer.
Jeypore.		Uluur.
Marwar or Jodhpur.		Sirohi.
Boondee.		Doongurpoor.
Bikaner.		Banswarah.
Kotah.		Pertabghur.
Kerowlee.		Jhallawar.
Kishnaghur.		
Bhurtpore.	Jat.	Dholepore.
	Mahomedan.	
	Tonk.	

Excluded from these are two purely British districts, Ajmir and Mhairwara. The Sind river marks the eastern boundary, as does the Indus that to the west. East of the minor Sind river, the hindu princes are excluded from Rajasthan or Rajwara. The productions of that vast tract are very varied, for while many provinces are remarkably rich and fertile, as on the black loam of the eastern districts, others like the sandy wastes of Bikanir and Jeysulmeer scarcely produce sufficient to support a scant and frugal population. Its desert wastes, over which the Rajput people spread themselves, have long been apportioned amongst the sovereigns of Jodhpore, Jeysulmeer, and Bikaner, who dwell in walled cities of some size but inconsiderable strength. The desert of India is known on its borders as Marust'hali, the region of death, from mri, Sans., to die, and st'hali, arid or dry land, but is also known as the desert of Rajputanah. Marust'hali is bounded on the north by the flat skirting the Garah; on the south by that grand salt-marsh, the Rin, and Koliwarra; on the east by the Aravalli; and on the west by the valley of Sind'h. It covers an area of 70,000 square miles. But for the Aravalli, which run N. E. and S. W., dividing Rajputanah into two equal parts, Central India would be submerged in sand; nay, lofty and continuous as is this chain, extending almost from the sea to Dehli, wherever there are passages or depressions, there floating sand-clouds are wafted through or over, and form a little t'hul even in the bosom of fertility. Whoever has crossed the Bunas near Tonk, where the sand for some miles resembles waves of the sea, will comprehend this remark. Its western boundary is alike defined, and will recall to the English traveller, who may be destined to journey up the valley of Sind, the words of Napoleon on the Lybian desert: "Nothing so much resembles the sea as the desert: or a coast, as the valley of the Nile." This desert has small scattered spots of fertility with great arid portions called t'hul, denoting tracts particularly sterile, and therefore the converse of the oasis of the Greeks, and each with a distinct name as the t'hul of Kawur, the t'hul of Goga and others. A tradition exists, to the effect that in remote ages, it was ruled by Powar

or Pramara rajput princes, from nine fortresses, viz., Poogul, Mundera, Maroo, Aboo, Kheraloo, Parkur, Chotun, Oomarkot, Arore and Lodorva. From Bhisatra on the Looni, throughout the whole of Dhat and Oomrai-Soomra, the western portion of Jeysulmeer, and a broad strip between the southern limits of Daodpotra and Bikaner, there is real solitude and desolation. But from the Sutlej to the Rin, a space of five hundred miles of longitudinal distance, and varying in breadth from fifty to one hundred miles, numerous oases are found, where the shepherds from the valley of the Indus, and the t'hul pasture their flocks. The springs of water in these places have various appellations, ter, par, rar, dur, all expressive of the element, round which assemble the Rajur, Soda, Mangulia and Sehrai, inhabiting the desert. A traveller proceeding from the "Khuchee" or flats of Sind to the east, sees the line of the desert distinctly marked, with its elevated teebe, or sand ridges, under which is the bed of the Sankra, which is generally dry except at periodical inundations. These sand-hills are of considerable elevation, and may be considered the limit of the inundation of the 'Sweet-river,' the Meeta Muran, a Scythic or Tartar name for river, and by which alone the Indus is known from the Punjnad to the ocean. The whole of Bikaner and that part of Shék-havat, north of the Aravalli, are comprehended in the desert. Jeysulmeer is nearly in the centre of what may be termed entire desert, is, in fact, an *oasis*, but the largest oasis of the desert, everywhere insulated by immense masses of t'hul, some of which are forty miles in breadth. The rock on which the castle is built has three peaks, or tri-cuta. Westward from this, from 400 or 500 miles, with one or two hundred miles in breadth, are little scattered oases, on which the shepherds of the desert have their huts. Water is at an immense distance from the surface throughout the Indian or Rajputanah desert, which, in this respect, as well as many others, differs very materially from that portion of the great African desert in the same latitudes. Water at twenty feet, as found at Mourzook by Capt. Lyon, is a circumstance, in the Indian desert, unheard of. At Daismok'h, near the capital, the wells are more than two hundred cubits, or three hundred feet, in depth; and it is rare that water fit for man is found at a less distance from the surface than sixty feet, in the tracts decidedly termed t'hul or 'desert,' though some of the flats, or oases, such as that of Mohilla, are exceptions, and abundance of brackish water fit for cattle, is found throughout at half this depth, or about thirty feet. All the wells are lined with basket-work made of p'ok twigs, and the water is generally drawn up by hand-lines. Water is sold, in all the large towns, by the mali or

gardener race, who have the monopoly of this article. Most families have large cisterns or reservoirs, called *tanka*, which are filled in the rainy season. They are of masonry, with a small trap-door at the top, made to exclude the external air, and having a lock and key affixed. Some large *tanka* are established for the community, and this water keeps sweet for eight and twelve months' consumption.

The Bikaner region is but little known to Europeans, by whom it has hitherto been supposed to be a perfect desert, unworthy of examination. And its deterioration, within three centuries since the Rajput supplanted the Jit, almost warrants our belief of the assertion that these deserts were once fertile and populous. The princes of Bikaner used to take the field at the head of ten thousand of their kindred retainers; and to other causes than positive sterility must be attributed the wretched condition of this state. The commercial towns of Chooru, Rajgurb, and Rinne, as entrepôts, supplied the country with the productions of Sind and of the provinces to the westward, or those of Gangetic India; the same cause affected Jeysulmeer, Bikaner, and the more eastern principalities; the Maldore of Jeysulmeer and the Larkhani of Jeypoor were as notorious as the Beedawut of Bikaner; and to these may be added the Sahara, Khosa and Rajur, in the more western desert, who, in their habits and principles, Tod describes as demoralized as the bedouins of Arabia.

The line of greatest breadth of Bikaner extends from Poogul to Rajgurb, and measures about 180 miles, while the length from north to south, between Bhutnair and Mahajin, is about 160 miles: the area may not exceed twenty-two thousand miles. Formerly they reckoned two thousand seven hundred towns, villages and hamlets scattered over this space, one-half of which are no longer in existence. The tract to the north-west of Jaelpoor in Colonel Tod's time was perfectly desolate, and nearly so from that point to Bhutnair: to the north-east, the population was but scanty, which observation also applies to the parts from the meridian of Bikaner to the Jeysulmeer frontier; while, internally, from these points, it is more uniform and equals the northern parts of Marwar. A census of the twelve principal towns may furnish a tolerably accurate approximation on this point:—

Chief Towns.	Houses.	Chief Towns.	Houses.
Bikaner.....	12,000	Mahajin.....	800
Nohur... ..	2,500	Jaelpoor... ..	1,000
Bahaderan... ..	2,500	Beedair.....	500
Rinne.....	1,500	Ruttungurb... ..	1,000
Rajgurb... ..	3,000	Daismookh... ..	1,000
Choord.....	3,000	Senthal... ..	500

It was estimated that there were 1,200 villages and 107,856 houses, with a total of 539,850 souls, giving an average of twenty-five to the square mile. Three-fourths of the people are Jit ; the rest are their conquerors, descendants of Beeka, including the Sarote brahmins, charuns, bards, and a few of the debased classes, whose numbers are not one-tenth of the Rajputs.

In the valley of the Ganges, the body of the Rajput population lies next to the Jat race to the east, in the Middle Doab, Rohilcund and Oudh, and still further east the country is shared with a brahman population. In lower Rohilcund, where they are called Thakur, rajput communities are strong and numerous, also numerous in Western Oudh, but they have never largely entered the British Sepoy Army. In the Central Doab, in the districts of Mynpuri, Futtehgur and Etawah, rajputs are numerous, and many served in the British Native Army ; but Eastern Oudh, especially most of the broad tracts between the Gogra and the Ganges, is the home of the great rajput population which supplied so large a portion of the Bengal Native Army. At home, these rajputs are a purely agricultural populations. Baiswara, the country of the Bais rajputs, lies almost parallel to the brahman country of the Lower Doab, and furnished many sepoys.

To the east of Oudh, rajputs are pretty numerous in Azimghur and Ghazipur.

In the Gangetic valley, the Rajputs spread over a broad region into a large population, and are essentially the cultivators of that valley. Physically, the rajput and brahman of that region are not different. The modern rajput is quite as strict as a hindu, and more prejudiced than many brahmins, and, upon the whole, was the worst class in the revolt and rebellion of 1857-8. The Rajput, in general, are illiterate, and confine themselves to arms and agriculture, they also keep cattle. They everywhere speak dialects of the ordinary Hindi. They are not supposed by Mr. Campbell to be the old Kshatrya race, noticed in the early brahmanical books, as existing many hundred years before the Christian era, though they have taken the place assigned to the Kshatrya. Also, the term Rajput, son of a raja, is not a term used by all Rajputs. In some parts of their country, they call themselves thakur, which means chief or noble. They are, however, frequently distinguished by the name of their tribe as Chouhon, Rahtor. Their practice is not to marry into their own but into another tribe, and this has assimilated the tribes to each other. The Baghel, also Waghel, is a Rajput tribe, Europeans have become acquainted with the rajputs as soldiers, but in their own villages, on the plains of the Ganges, they are simple agriculturists, of a constitution very like that of the Jat race, only less pure and complete. Rajputs are, however, falling in the world. The armies

they have furnished have exhausted the material ; infanticide has diminished their numbers ; and their wives, shut up like those of mahomedans, give no aid in agriculture. Over great tracts, the Rajputs are a feeble minority. In some parts, however, the agricultural Rajput villages are strong and numerous ; every Rajput is free and equal, the land is divided amongst them, and the commune is administered on democratic principles : wherever this is the case, their institutions resemble those of the Jat race. The Rajputs do not greatly revere brahmins, but the Rajput, unlike the Jat, has adopted fully all the ceremonies and superstitions of hindu caste, are very particular about caste marks, and cook once a day with great fuss and every man for himself. Their daughters are married to men of the best tribes, and their widows are not permitted to re-marry, and it is the point of honour as to their daughters' marriages, that led to the practice of infanticide.

The north-eastern Punjab and Cis-Sutlej districts seem to have first been a brahman, then a rajput country, and subsequently advanced upon by the Jat. It is not clear whether the Bhatti of Bhattiana were originally Rajputs or really are Yuti or Jat. But from Bhattiana northwards, Rajput villages are scattered about in considerable numbers amongst the Jat, and there are traces of more extensive Rajput possessions. The Rajputs seem to be here undergoing gradual submersion. But, in the extreme north of the Barce and adjoining Doabs of the Punjab, there is still a strip immediately under the hills which may be classed with the adjoining hill country as still mainly Rajput. Even in Rajputanah proper, though it has Rajputs for the dominant race, the population is much more Jat than Rajput, the Jat extending continuously from the Indus to the Ganges. The great seat of Rajput population and ancient power and glory was on the Ganges. Since vanquished there by the mahomedans, the principal Rajput families have retired into the comparatively unfruitful country to which they give their name, but where, nevertheless, the Jat form the most numerous part of the population. Before the Rajputs were driven back from Ayodea and the Ganges, northern Rajputanah was partitioned into small Jat republics. The more open parts of Rajputanah are shared amongst the Meena, the remains of the brahman population, the Jat and the dominant Rajput, but the Jat possess the largest share in the cultivation. The southern and more hilly parts of Rajputanah is much occupied by the Meena, the Mhair and Bhil, and the province of Malwa is occupied by Rajput, Kunbi and Jat. Rajputs and Jats occupy the plains south of the Salt Range, and seem later immigrants than the brahmins.

There are spaces of fifty miles without a drop of water, and, without great precaution, impassable. The sand hills rise into little mountains, and the wells are so deep, that with a large kafilah or caravan many might die before the thirst of all could be slaked. The enumeration of a few of these will put the reader in possession of one of the difficulties of a journey through Maroo; they range from eleven to seventy-five *poorsah*, or seventy to five hundred feet in depth. One at Jeysing desir, fifty *poorsah*; Dhote-ca-bustee, sixty; Girap, sixty; Hamirdeora, seventy; Jinjinali, seventy-five; Chailak, seventy-five to eighty.

Europeans in India have adopted the habit of designating the principalities of Rajputanah by the names of their respective capitals, instead of those of the countries. Thus Marwar and Mewar are recognized under the titles of their chief cities, Jodpoor and Oodipoor. Kotah and Boondi are denominations indiscriminately applied to Haravati, the general term of the region, which is rarely mentioned; and Dhoondar is hardly known by that denomination to Europeans, who refer to the state only by the names of its capitals, Amber or Jeipoor, the last of which is now universally used to designate the region inhabited by the Cuchwaha rajput race: the maps define the existing boundaries of this principality, to which are indiscriminately applied the terms (as is the practice of the natives) of Dhoondar, Amber, and Jeipoor.

Like all the other Rajpoot States, the country of the Cuchwaha is an assemblage of communities, the territories of which have been wrested from the aboriginal tribes, or from independent chieftains, at various periods; and therefore the term Dhoondar, which was only one of their earliest acquisitions, had scarcely a title to impose its name upon the aggregate. The etymology of Dhoondar is from a once celebrated sacrificial mount (d'hoond) on the western frontier, near Kalik Jobnair. The Cuchwaha or Cuchwa race claim descent from Cush, the second son of Rama, king of Koshula, whose capital was Ayodia, the modern Oudh. Cush, or some of his immediate offspring, is said to have migrated from the parental abode, and erected the celebrated castle of Rhotas, or Rohitas, on the Soane. Excluding Ajmir, a small British territory, situated almost in the centre of Rajputanah, the whole of the 122,519 square miles of Rajputanah, contains no less than nineteen independent States. The larger of these are:—

	Sq. m.	Inhabitants.
Marwar.....	35,672	1,783,600
Jeypore.....	17,000	1,891,124
Meywar.....	11,614	1,161,400
Bikaner....	12,252	539,250
Jeysulmeer, ...	12,252	74,000

Bikaner and Jeysulmeer form the barrier between the deserts to the west and the more fertile lands to the east, and contain vast and sandy steppes, where the water is brackish frequently two thousand feet from the surface, and where, consequently, human beings with difficulty exist. Of the smaller and more fertile States, there are viz. :—

	Sq. m.	Population.
Kotah.....	4,339	438,900
Bhurtpoor.....	1,978	600,000
Ulwar....	3,573	280,000
Kerowlee.....	1,878	187,800
Dholpoor.....	1,626	550,000
Kishenghur....	724	70,953
Banswarrah.....	1,440	144,000
Doonghulpore.....	1,000	100,000
Pertabghur.....	?	?
Dowleah.....	1,457	145,700
Jallawar.....	2,200	220,000
Tonk.....	1,864	182,673
Sirohee.....	3,024	151,200

The population of the British territory of Ajmir amounts to 345,415 or 2660 sq. miles, and with the exception of Dholpoor and Bhurtpoor, the Ajmir district contains a larger number of inhabitants to the square mile than any of the Independent States. In these, the average is 71 to the square mile, but in Marwar the number is only 50, in Bikanir 35, while there are so few as 6 to the mile in Jeysulmeer. In the British provinces lying to the south there are in Jubbulpore 102, and in Nagpore and Wurdah 150.

The absence of any organized system of police permits the passage of marauding bands throughout the whole country. The rajahs oppress the thakoors or nobles, and these again oppress the people.

The chief States, at present, are those of Udiipur, Amber or Jaipur, and Marwar; and the minor kingdoms, are Ulwar, Bikaner, Dangarpur, Sirohi, Pertabghur, &c., which were at one time the fiefs or dependencies of the first three though subsequently acquiring independence. Udiipur was founded in A. D. 144 by rajah Kunnksen, a Chohan rajput, an offshoot of the royal house of Ayodhya of the Solar race. Amber or Jaipur, by Sura rajah, a Cuchwaha rajput, in A. D. 966, and Marwar in 1459 by rajah Jodh, a Rathor rajput of the Kanouj dynasty.

British political relations with these States commenced fairly in the year 1803, during the Mabratta war. In 1817-18, on the outbreak of the Pindaree war, the British Government offered its protection, and treaties were contracted separately with all the states. The object of these engagements was not to acquire the power of exercising any interference in the

internal administration of these States, but simply to subject their political measures and external relations to the British control. The feudatory chiefs of Rajputanah are consequently independent rulers, so far as their civil and criminal jurisdiction is concerned, and the British have no authority over them in these respects, beyond the indirect authority of moral influence. The laws by which they govern are unwritten, customary, and based upon the hindu shastra, and are administered by persons whose tenure of office depends solely upon the pleasure of the chief. The thakoors, or landed aristocracy, have certain powers delegated to them by their chiefs, and are held responsible for the security of life and property within the limits of their estates. They hold their lands on condition of paying an annual rent or tribute, and maintaining soldiers for the service of the State. The relations between them and their liege lords are consequently somewhat similar to those of the feudal system. Some of them are almost as unfettered by control in the internal administration of their estates as the chiefs themselves. The character of the Government is mild, and the tendency is towards excessive leniency rather than severity. Capital punishment is rarely awarded, fine and imprisonment being the usual penalties. Still, there are occasional cases of cruelty, chiefly affecting offences against caste or religion, and the British Political Agents never allow these to pass unnoticed and do their best to prevent. The great bulk of the population is both well contented and prosperous. Although the administration of British provinces is incomparably superior in every respect to the administration of these principalities, it may be fairly questioned whether, as a body, the people are better satisfied. Whilst material wealth and progress are far greater and more rapid in British India than in Rajputanah, less actual poverty and destitution are found in the latter. Highway robbery, and border affrays, dacoity and cattle robbery seem to be the staple crimes of the Rajputs. The main income of all the Rajput States is derived from the land revenue. Salt is the next important source, and a considerable amount is realized from transit duties. The land revenue is raised under different systems, according to the custom of each particular State. In most it is taken in kind. The Government often leases out villages to contractors for short terms of years. Education has not made much progress in Rajputanah. There are schools in all the capitals, but the aristocracy do not set an example to the rest of the population in availing themselves of the opportunity afforded them of educating their children. The Thakoors, as a body, are illiterate and opposed to progress of any sort. The road

communications of Rajputanah are generally defective. The military establishments of the States show a grand total of 73,050 men, but the equipment and discipline of the force are very inferior. The capabilities of parts of the country for cotton are excellent, and it grows wild and to a good height even in the western sandy tracts. In some parts of Meywar and others of the smaller States the luxuriant growth of the poppy recalls to recollection the opium fields of Central India. Most of the cereals can be successfully cultivated. Hopes are entertained of its mineral resources proving valuable, while even in the most arid districts salt and salt-petre are obtained in abundance. The great Sambhur lake near the northern frontier of Marwar contains an inexhaustible supply of salt, though it has never been rendered available by the Rajputs, and the British have recently, by treaty, obtained possession of it.

Dhar, Dewass, Doongurpoor, Banswarra, Pertabghur, Rutlam, Sillanah, Seeta Mhow, &c., are petty Rajput principalities.

Salt is a main article of export. There is also considerable traffic in sugar, cotton, country cloth, and wood. The sugar of Rohilcund and the North-Western provinces is the staple of the import trade. It is estimated that the total external trade of the various frontiers amounts to £2,213,700 worth of exports, and £1,761,500 worth of imports. British political relations are maintained through the channel of a Governor-General's Agent with a staff of four Assistants and five Political Agents, accredited respectively to the courts of Mewar, Jeypore, Marwar, Bhurtore, and Haraootee. The Governor-General's Agent superintends the principalities of Bikaner, Jeynulmeer, Kishangbur, Kerrowlie, Ulwur, Tonk and Dholepore. The Political Agent of Mewar has jurisdiction over Mewar, Pertabghur, Doongarpore, and Banawarra. Jeypore has a political agent to itself. The political agent of Marwar has also Jodhpore and Mullanee under his control.

The jurisdiction of the agent in Bhurtore is confined to that State, but lately he has been entrusted with all the more important matters connected with Dholepore. The agent in Haraootee is accredited to the courts of Boondee, Kotah, and Jallawar. The first Assistant to the Governor-General's Agent is political superintendent of Sirohi and magistrate of Aboo. The second assistant is the agent for the suppression of thuggee and dacoity in Rajputanah. Besides the staff above enumerated, there is a separate civil commission for the administration of the British districts of Ajmer and Mairwarra, under the Government of the North-Western provinces. It consists of a deputy commissioner, first and second assistant commissioners, a Cantonment Magistrate at Nus-

serabad, a Revenue Settlement Officer, a District Superintendent of Police and his Assistant, with the Governor-General's Agent as ex-officio Commissioner.

Bikaner, which is a large State, with an area of 17,680 square miles, is under the Governor-General's agency. The population is sparse, and the country, together with that of the contiguous State of Jeysulmeer, is known as the "Indian Desert." Its general character is a succession of sand hills, covered with small trees and bushes. Barren as it appears to the traveller in the scorching heat of the summer months, it produces plentiful harvests of bajree and mot'h, water melons and oil plants. The administration is not considered to be satisfactory. Bikaner, the capital town, has a population of about 60,000, and contains the homes and houses of many opulent merchants and bankers, who live in other parts of India, and return periodically to their native place. Of late years, however, the number of those who came back has sensibly diminished.

Jeysulmeer is governed by a maha rawul. The revenue of this desert state is insignificant, and the water below the surface lies at an enormous depth, varying from two to five hundred feet. The city of Jeysulmer was, like Bikaner, the resort of many rich natives, who stored their wealth there, to escape the exactions from time to time of the Mogul, the Mahratta and the Pindari; situated in the heart of the most arid desert in India, it was a city of refuge that escaped the notice of depredators, or seemed inaccessible to them.

Kishenghur is a small State on the eastern frontier of Ajmere, administered by a maharajah. Observing the benefits derived in Ajmere by the system of tank irrigation, introduced by the late Colonel Dixon, its chief had a number of tanks excavated in his state and the revenues considerably increased. The salt that is exported from the Sambhur lake to Central India has to pass through his province, and pays a duty of about 3 annas per maund. The products of Kishenghur consist mainly of excellent crops of cereals, and wheat, barley, Indian corn, and jowree are raised.

The State of Kerrolee is under the chieftainship of a maharajah.

Though the territory known as Rajasthana and Rajputanah spreads through the Indus deserts, to Sind westward, and southwards to Cutch and Guzerat, and takes its name from the Rajput races ruling in it, there are innumerable sub-divisions of the rajput race in Malwa, and extending from Babar and Benares through the N. W. Provinces of India up to the Punjab. The Rajputs claim to have sprung from the ancient solar and lunar dynasties, and form themselves into the Suryavansa or solar and the Indra

or Chandravansa or lunar tribes, and there is a tribe styled Agni Kula from having sprung from a sacred fire (igni) which Agastya kindled on Mount Aboo. The three solar races are the Gehlot, Rahtor and Kachwaha. The four Agni Kula are the Pramara with 35 Sakha; the Parihara with 12 sub-divisions; the Chaluksya and Chauhan, with 24 branches. Of the Pramara, the Mori are best known, and of the Chauhan, the Hara, who give their name to Haraoti, and have the two rajahs of Kota and Bundi. The single lunar race, or that of the Yadu or Jadu, sprung through Krishna, has eight branches, of whom the Jhareja with their raja of Cutch and the Bhatti with their rajah of Jeysulmeer are best known.

The Dogra of the Jummoo Hills also claim to be rajput, and there are likewise rajputs in the Kangra and Simla hills.

Rajputs rule in Rajputanah, where they are numerous and dominant aristocracy, organized on the feudal principles necessary to domination, though the greater part of Rajputanah is ethnologically more Jat than Rajput. Rajputanah lies in the centre of a circuit all round the edge of the more compact mass of the Jat people,—from the Salt Range, through the northern Punjab and adjoining hills, to Rohilcund, Oudh and the Centre Doab, thence by Bundel through Sindiah's territory, Malwa, Mewar, Guzerat and Kattywar into Lower Sind. They are not found in any number to the north of the Salt Range, nor are they in any of the hill country west of the Jhelum. A large proportion of the Rajputs scattered about the Eastern Punjab, Cis Sutlej territory, and Delhi districts are now mahomedans, as are occasional Rajput villages all over Hindustan and a good many Rajput rajas, their conversion having been influenced by the moghul emperors. But east of Delhi, conversion is quite the exception. A small Rajput tribe, called Jan-jua, now mahomedans, is however found about the Salt range.

In the N. E. Punjab near the hills, the Rajput population is more numerous, and hindu Rajputs are the dominant race in the Jummoo and Kangra districts of the Himalaya. The Kangra and Jummoo rajahs and their clans claim to be of very pure blood, and they are fine handsome men, the Kangra Rajputs in particular: they wear many jewels and are very fair. The women of the hills are in deserved repute and much sought after in the plains. The Jummoo men, called Dogra Rajputs, are less handsome than those of Kangra, but more robust and brave, quiet, staunch, steady and reliable, without disagreeable hindustani airs. The Rajput population of these hills must be very considerable. East of the Sutlej, in the Simla hills many of the rajahs and their followers are rajputs. The Dogra tribe, in the N. W. of India, are predatory

and pastoral, following mahomedanism but claiming to be Chauhan rajputs. The other converted Chauhan, however, believe them to have been Jat and Gujar. The rajah of Kashmir is a Dogar or Dogra. In the 18th century they occupied a considerable tract on the banks of the Sutlej and made themselves formidable to the mahomedan government of Delhi. The Rajputs of the Punjab and adjoining hills are supposed to be not so high on the scale of rajput orthodoxy as the solar and lunar races of Ayodiah. In the lower Doab, the Rajputs take the hindu royal designations of Raja, Rao, Bana and Rawat ; many Rajputs object to hold the plough. Rajput dominions run south of the Gogra and thence across the Ganges into the Arrah District (Bojpur).

The Jat, Rajput and their congeners are undoubtedly branches of one great stock. Brahmins of Kashmir and the frontier hills are hindus in an earlier stage of brahminical development. The Jat country is just such as would be occupied by a large stream of people issuing through the Bolan Pass, in Lat. 28 or 30° north, and the Rajputs are ranged in a semi-circular form around the eastern and northern and south edge of the Jat area, the mass of them occupying the richer valley of the Ganges. Mr. Campbell's conjecture is that the Rajput are an earlier wave from the same source as the Jat who came in by the same route, have farther advanced and been completely hinduized, while the Jat have come in behind them. Punjabi is the language spoken by the Jat, but which in upper Sind is called Jati-Gul or the Jat tongue, and Mr. Masson calls that of Beluchistan and Sind Jetki. It is an Indo-Germanic tongue allied to the Sanscrit. In its main grammatical and essential features it is not widely different from the Hindi of the Rajput and other Hindustani people. It is one of the most praerit of Indian vernaculars. There is no available data beyond the fourth century for any of the great Rajput families, all of whom are brought from the north. This was the period of one of the grand irruptions of the Getic races from Central Asia, who established kingdoms in the Punjab and on the Indus. Pal or Pali, the universal adjunct to every proper name, indicates the pastoral race of these invaders.

The Rajput race for about 1,800 years have been striving to get and hold India, but they have never advanced in strength beyond the north-west of India, and they now occupy from the north and west of the Punjab, south-east to Behar and Benares, and southwards along the left bank of the Indus to Malwa, Guzerat and Cutch, giving their name Rajasthans or Rajputana to the country they occupy. They are no doubt of Aryan origin, and are part of a later move-

ment than the branch who came down by the Saraswati, and up to the latest dates have shown themselves a brave people, delighting in war and in bloodshed. During the period down to Yoodishtra and Krishna, and thence to Vicramaditya, various races invaded India, who are now ranked amongst the thirty-six royal races of Rajasthan. These are the Hya or Aswa ; the Takshao ; and the Jit or Gitæ, the similitude of whose theogony, the names in the early genealogies and many other points, with the Chinese, Tartar, Moghul, Hindu and Scythic races, would appear to warrant the assertion of one common origin. Since they have been in India the great seat of Rajput ancient power and glory was on the Ganges ; but, when vanquished there by mahomedans, the chief Rajput houses retired into the comparatively unfruitful countries now known as Rajputanah, where, however, the Jat is the most numerous part of the people ; and though they share the lands with the Meena, the Mhair, the Bhil, the remains of the brahmin population and the dominant Rajput, the Jat have the largest share of the cultivation. The northern part of Rajputanah was partitioned into small Jat republics before the Rajputs were driven back from Ayodiah and the Ganges. The southern and more hilly parts of Rajputanah are not Jat, but are occupied by the Mhair, Meena and Bhil ; but in Malwa, again, the Jat are numerous, and seem to share that province with the Rajput and Kunbi. The Jat of Beluchistan are described by the people of Candahar as fine athletic men, with handsome features but rather dark. Those in upper Sind, up the course of the Indus, and in the south-western Punjab, are for the most part of the mahomedan religion. They have been long subject to foreign rule, and seem to be somewhat inferior to their unconverted brethren. In all the east Beluchistan, the Baluch are but a later wave and upper stratum. There, about the lines of communication between India and Western Asia, in the provinces of Sewestan and Kuch Gandava, the Jat form probably the largest portion of the agricultural population, and claim to be the original owners of the soil. In the west, advancing through Rajputanah, we meet the Jat of Bhurt pore and Dhol pore ; Gwalior was a Jat fortress belonging, it is supposed by Mr. Campbell, to the Dhol pore chief. They do not go much further south in this direction. From this point, they may be said to occupy the banks of the Jumna, all the way to the hills. The Delhi territory is principally a Jat country, and from Agra upwards, the flood of that race has passed the river in considerable numbers and forms a large part of the population of the Upper Doab, in the districts of Alighur, Meerut and Musafarnagar. They

are just known over the Ganges in the Moradabad district, but they cannot be said to have crossed that river in any numbers.

Briefly, the Rajput race now occupy from the north and west of the Punjab, south-easterly to Behar and Benares, and southwards along the left bank of the Indus to Malwa, Guzerat and Cutch, and give to their south-westerly holdings the name of Rajasthana or Rajputanah. They are no doubt of Aryan origin, and are part of a later movement than the branch who came down by the Saraswati.

Rajputs claim to have three origins: (1) the descendants of the Suryavansa, the ancient dynasty of the Sun; (2) the descendants of the Chandravansa, the ancient dynasty of the Moon; and (3) the Agnikula, the family of fire, a sacred fire said to have been kindled on Mount Aboo by the saint Agastya. From these three, thirty-six primary royal races are said to have sprung, of whom the following may be enumerated:—

Name.	No. of branches	Chief Representatives.
4. Chouhon or Chahu-	24	The Hara of Barwari, the rajah of Kota, Bundi, the Khichi of Ragughur, the Deora of Sirahi, the Sona garba of Jhalore and Pawachia of Pawaghar.
Chonra or Chonhara.	Hun.	Dahi.
Tak or Takshak.	Katti.	Sengar.
Jit or Jat.	Bhatta.	Gor.
Jhala-makwahana.	Gohil.	Dohia.
Sarwaya or Sariaspa.	Jetwa.	Johiya.
Sikharwal.	Kamara.	Gerhwal.
Birgujar.	Bais.	Mohil.
		Chandela.
		Nikumba.
		Luudela.
		Dahiria.
		Dahuna.

Besides these, there are many tribes claiming to be Rajputs, of whose origin little or nothing is known, viz.:—

Name.	No. of branches.	Chief Representatives.
A. 36 Solar or Suryavansa dynasties.		
1. Grahilot or Gehlot.	24	The Sisodhia is the most distinguished. The Rana of Udayapur is a Grahilote.
2. Rahtor, descended from Rama by Kusa, his second son...	24	The rajah of Jodpur or Marwar belongs to this tribe.
3. Kachwaha, also sprung from Kusa	12	The raja of Jeypur is of this tribe.
E. Yadu or Chandravansa or Jadu or Lunar dynasty sprung from the moon.		
1. Yadu or Jadu, descendants of Krishna.	8	The Jharija and Bhatta in Cutch and Jeyaulmeer are the most powerful.
2. Tuar	...	Vikramaditya was a Tuar.
C. Agnikula, or Fire race, have four tribes and 87 branches, viz.:—		
1. Pramara, west of Malwa and the desert of the Indus	35	The Mori, Soda, Sankla, Khair, Umar; Sunra (now mahomedans) Vehl Mairawat; Balhar Kaba; Omata, Rebar, Dhundia, Sortla, Harir little known.
2. Parihara.....	12	
3. Chalukia of great power in the 11th 12th and 13th centuries.....	16	The Bhagel branch.

The four Agnikula tribes of Rajputs are the Chohan, Chalukya or Solunkee, Pouar or Prumar, and the Purihar. The unnamed progenitors of these races seem to have been invaders who sided with the brahmins in their warfares, partly with the old Khutree, partly with increasing schismatics, and partly with invading Græco-Bactrians, and whose warlike merit, as well as timely aid and subsequent conformity, got them enrolled as "fireborn," in contra-distinction to the solar and lunar families. The Agnikula are now mainly found in the tract of country extending from Oojein to Rewah near Benares, and Mount Aboo is asserted to be the place of their miraculous birth or appearance. Vikramaditya, the champion of brahminism, was, according to common accounts, a Pouar Rajput.

Several tribes of Rajputs and Kathi are found in the peninsula of Guzerat, commonly known under the name Kattiwar Rajput, amongst whom there are several tribes, standing in power and wealth thus: 1. Jharejah; 2. Jhallah; 3. Gail, and 4. Jetwah.

The Jharejah are the most powerful and numerous of the Rajput tribes of Guzerat and possess all the western part of that peninsula. They are a branch of the family of the rao of Kutch, who, in consequence of intestine feuds, left their country about A. D. 800; and having crossed the Runu, at the head of the gulf of Kutch, established themselves upon the ruins of the Jetwah Rajputs and a few petty mahomedan authorities which at that time existed in Halar. The lands appear to have been divided in common among the whole tribe; the teelat, or eldest branch of the family, reserving to itself the largest portion; whilst the bh'yau-

or brotherhood held their respective villages by a pure feudal tenure. The outlaws amongst them, the Bharwuttia, acted with great violence. If a Bharwuttia failed in getting flocks, he seized the persons of such villagers as he could find and carried them off. These were styled bhan, or captives, for whose release sums of money were demanded. In short, the life of a Bharwuttia was one of blood and rapine, until he was killed, or by the fury of his feud he compelled his chief to grant him redress; and the security of Charan (religious persons) and bhat (Bards) having been given on both sides, the outlaw and his family returned to their homes and occupations in perfect security. The Jharejah are said to trace their origin from Jhara, a chief of the mahomedan tribe of the Summa of Sindh.

The Rajputs in the south and west of Malwa and in Mewar are called Rangari, the derivation of the term is obscure.

Rajputs of the N. Western hills are ethnologically a much purer and finer race than those on the plains, but even they assert that their ancestors came from Ayodia or Oudh.

The chief Rajput districts are Bikanir, Jeysulmeer, Marwar, Mewar, Ajmir, Jeypur, Bundi, Kotah and Malwa.

The Bhatti are of the Yadu Bhansa race and rule in Jeysulmeer, and give their name to the Bhatti country between Hissar and Garhi.

In the Rajput states of Jeysulmeer between Lat. 25° to 28° N. and Long. 69° to 72° E.; of Jodhpur or Marwar, Lat. 24 to 28° N. and Long. 70° and 75° E. of Ajmir or Rajast'han; and also on the N. and E. in Lahore, Mooltan, Delhi, Agra, Malwah, Mewar, Marwar, Bikanir, Guzerat, Oudh, Allahabad and Bahar, indeed in the entire tracts lying between the Vindhya on the south, the Himalaya on the north, the Indus on the west, and Bengal and Assam on the east, are spoken the dialects which are called Hindi, some of which contain Sanserit words, to the extent of nine-tenths of their entire vocabules. All Rajputs speak Hindi. The Sindi, Panjabi and Kashmiri are likewise described as Hindi dialects. But the people speaking these tongues are of different races. Amongst the races in this tract are the Mhair of Ajmir, the Rajput, the hindu of the eastern countries, called Purbhiah, and the descendants of the Arian conquerors who have been residing there nigh two thousand years. They are of large physical frame, proud, vain, self-reliant and abstemious.

The maharana or rulers of Mewar, the capitals of which are Chitor and Udayapur, are of the race who ruled in Saurashtra. After the destruction of the Balhara monarchy of Saurashtra and two centuries' sojourn of the family in the Bhandar desert, Baph or Bappa conquered

Chitor and founded a new dynasty, in A. D. 727. The hereditary title was changed from Gehlote to Aditya. In 1828, Jewan (Javan) Singh, the only survivor of the race of Bappa, was on the throne.

The Mewar Agency is now entrusted with the political superintendence of (1st) Mewar or Oodeypur, (2nd) Pertabghur, (3rd) Doongurpur, and 4th, Banswarra. The city of Oodeypur is picturesquely situated on the eastern bank of a large lake, which is studded with rocky islets, and girt with wooded hills. The soil of Mewar is rich, and the surface of the country is not disfigured by any of those patches of sand which are to be met with in other parts of Rajputanah. Lying to the south-east of the Aravalli, it is a hilly tract, and the ascent to it is steep. Zinc ore is found near Oodeypur. There are said to be unworked mines, from which, in olden times, large quantities of silver were extracted. There is a magnificent lake at Rajnuggur, the area of which is about 12 square miles, and the depth considerable. The masonry of the bund of this lake is a splendid specimen of work. The wall is 40 feet in height in some places, and faced with marble, and the length of the embankment is not under two miles. He has a difficult population to manage. His nobles are factious, and assume almost independent powers, and in the hilly districts dwell wild and lawless tribes of Bhil, who, until taught otherwise, knew not what commerce means, except that it is an institution to be preyed upon. They are divided into 16 clans, with a population of about 150,000, and a fighting force of 30,000. On the approach of danger, signals were made from 'pal' to 'pal,' and the fighting men turn out at a moment's notice to repel the intruder. The income of Mewar amounted in 1865-66 to Rs. 26,61,273, and the expenditure to Rs. 26,85,729, showing a deficit of Rs. 24,456. The state of Mewar is governed by a maharana.

The small state of Doongurpur is administered by a maha rawul, and is not unlike the hilly tracts of Mewar. The revenue amounts to Rs. 1,26,818, and the expenditure to Rs. 1,71,364. The tribute that is paid to the British Government, viz., Rs. 35,000, seems to be disproportionally heavy. Pertabghur belongs to the Alpine division of Rajputanah, like Doongurpur? and, although generally hilly, possesses valleys and small plains of a rich loam soil, yielding abundant crops.

The Rajputs in the south and west of Malwa and in Mewar are called Rangari, a name, the derivation of which is obscure. The hills of Mewar and the neighbourhood are however still held by aboriginal tribes. The princes of Khundalla are a branch of the Shekhawut, the most powerful of whom are the Sadhani.

The Sadhani are descended from Bhojraj, the third son of Rasesil, and in the division of fiefs amongst his seven sons, obtained Oodeypur and its dependencies. Bhojraj had a numerous issue, styled Bhojani, who arrogated their full share of importance in the fancy of the confederacy. Khundaila is said to have derived its name from the Khokur Rajput. The Khokur is often mentioned in the Bhatti annals, and Colonel Tod supposed them to be the Ghuker, who were certainly Indo-Scythic. Khundaila in the early part of the 19th century had four thousand houses and eighty villages dependent on it.

The ancient name of Oodeypur is said to be Kâes; it contains three thousand houses and has forty-five villages attached to it, divided into four portions.

The *Chahil* or *Chahira* Rajput tribe is now, for the greater part, converted to mahomedanism. There are a few in the Hissar district and on the borders of Bikaner. Though mahomedans, they nevertheless retain charge of the tomb of Goga Chauhan, a hindu prince, now esteemed a saint.

Ajmir is a Rajput country among rugged mountains and close valleys, which long preserved independence, and in a great measure, down to the present time is, in respect of Hindoostan, what the country of Switzerland, is to Europe, but much more extensive and populous. From Mahmud to Aurungzeb, the Indian conquerors were contented with the nominal subjection of the hardy Rajput tribes of Rajputanah among whom military enthusiasm, grafted on religious principles, is added to strength and agility of body; and this race is disseminated over a tract equal to half the extent of France.

The *rajas of Malwa*, the capitals of which are Ujjayana and Mandor, are known from the writings of Abul Fazl, whose information is supposed to have been furnished from Jain authorities. It would appear that, in early ages, Mahamah founded a fire temple, which was destroyed by buddhists, but restored in B. C. 840 by Dhanji (Dhananjaya) a name of Arjun, about 785, before Vikramaditya. From A. D. 1200 and A. D. 1390, the country repeatedly changed hands, from hindu to mahomedan sovereigns, from the time that in A. D. 866, Maldeva was conquered by Sheikh Shah, father of Ala ud din, to A. D. 1390, when Dilawar Khan Ghorî, viceroy of Malwa, assumed sovereignty in A. D. 1390.

The *Chahaman* or *Chohan* has been the most valiant of the Agnikula, and not of them only, but of the whole Rajput race. Its branches (*sak'ha*) have maintained all the vigour of the original stem; and the Hara, the Khechee, the Deora, the Sonigurra, and others of the twenty-four, have their names immortalized in the song of the bard. The derivation of Chohan

is coeval with his fabulous birth from the four-handed warrior Chatoor-bgoja, Chatoor-baba Vira. The Chohan trace their descent from Prithi raj. They are found all over the N. W. Provinces, also in Malwa and Rajasthan, in Central India, in Rajor, Fratapur, Chakarnagar, and Manchana, of which last the raja of Mainpuri is the head, and is one of the highest of the Chohan clan. The Chohan rajput of the desert has on the N. and E. parts of Marwar, to the south there is Koliwarah and the Runn, to the west the desert of Dhat. The sterile ridge which passes through Chotun to Jeyzulmeer passes west of Bankasir on to Nuggur Parkur. The wells are 65 to 130 feet deep. The Sehrai, Khossa, Koli and Bhil inhabitants are predatory races. The Chohan Rajput does not wear the zonar and does not much respect the brahmins. The Pit'hil and Bania are farmers and traders. The Chohan Rajputs are to this day one of the highest and most powerful of the military tribes of Malwa.

The *Purihara* or *Pritihara* is scattered over Rajasthan, but do not seem to have any independent chieftainship there. At the confluence of the Cohari, the Sind, and the Chumbul, there is a colony of this race, which has given its name to a commune of twenty-four villages, besides hamlets, situated amidst the ravines of these streams. The *Purihara* is the least of the Agnikula. They never acted a conspicuous part in the history of Rajasthan. Mundawur (classically Mundodri) was the capital of the Purihara, and was the chief city of Marwar which owned the sway of this tribe prior to the invasion and settlement of the Rahtor clan.

The *Bach* is an inferior tribe of Chohan Rajputs in the district of Jonpur.

The *Bais* or *Beis* Rajputs are one of the 36 royal races, and intermarry with the Chohan, Kachwaha, and others. They claim to have come from Manji Paithan in the Dekhan, and to be descendants of its king Salivahana, of A. D. 78. They give their name to the Bycewara district in the Doab.

The *Langa* are a sub-division of the Solanki or Chalook race, one of the four Agnikula; in their gotra-acharya, or 'genealogical creed,' they claim Lokote in the Punjab as their early location, in all probability prior to their regeneration on Mount Aboo, when they adopted brahminical principles. From the year S. 787 (A. D. 731), when the castle of Tunnote was erected by the leader of the Bhatti colony, down to S. 1530 (A. D. 1474), a period of seven hundred and forty-three years, perpetual border-strife appears to have occurred between the Bhatti and Langa, which terminated in a singular combat, or duel, of tribe against tribe, during the reign of rawul Chachik, in the last-mentioned period.

The *Cuckhwaha* tribe are the ruling race in Ambar of Jeypur; its raja is a Cuckhwaha. The greatest breadth of Ambar lies between Sambhur, touching the Marwar frontier on the west, and the town of Surout, on the Ját frontier, east. This line is 120 miles, whilst its greatest breadth from north to south, including Shekhawati, is 180 miles, with about 150 souls to the square mile. Dhoondhar, the parent country, is calculated to contain four thousand townships, exclusive of the *poorwá*, or hamlets, and Shekhawati about half that number. Rajputs bear but a small ratio to the rest, whilst they may equal in number any individual class, except the aboriginal Meena, who are still the most numerous. They are, according to their relative numbers, Meena, Rajput, Brahmin, Bania, Ját, Dhakur or Kirár (qu. Kiráta ?) and Goojur. The Meena are subdivided into 32 distinct clans; the original induction of the exiled prince of Nurwar to the sovereignty of Amber, was commemorated on every installation by a Meena of Kalikh marking with his blood the *teeka* of sovereignty on the forehead of the prince. The blood was obtained by incision of the great toe: like many other antiquated usages, this has fallen into desuetude here, as has the same mode of inauguration of the rana of Mewar by the Ondeva Bhil race.

Haravati, or *Harouti*, the country of the Hara, comprehends two principalities, viz., Kotah and Boondi. The Chumbul intersects the territory of the Hara race, and now serves as their boundary, although only three centuries have elapsed since the younger branch separated from and became independent of Boondi. The *Hara* is the most important of the twenty-four Chohan *sac'há*, being descended from Anuraj, the son of Manik Rae, king of Ajmer, who in S. 741 (A. D. 685) sustained the first shock of the mahomedan arms.

Of the four *Agnikula* races, the *Chohan* were the first who obtained extensive dominion. The almost universal power of the *Pramara* is proverbial; but the wide sway possessed by the Chohan can only be discovered with difficulty. Their glory was on the wane when that of the *Pramara* was in the zenith; and if we may credit the last great bard of the Rajputs, the Chohan held *in capite* of the *Pramara* of Telingana, in the eighth century of Vicrama, though the name of Prithiraj threw a parting ray of splendour upon the whole line of his ancestry, even to the fire-fountain on the summit of classic Aboo.

The *Sammah* were certainly Rajputs, and the present Jarejah of Cutch still derive their origin from them.

The *Sodho* clan is numerous about Omerkot and the Tharr, where they are the hereditary sardars of the country. Under the amears,

their headman lived at Tannacheri and was never interfered with in his prerogatives. Although hindus, they intermarry with mahomedans, and do not refuse to eat with them.

The *Rajputs of Guzerat*, were chiefs on the frontiers, who in the early part of the 19th century regularly levied tora-grass, or black mail, but before its middle had become pensioners.

The *Baghel* are a branch of the Sisodhya Rajputs of Guzerat, who migrated to the east, and gave their name to Baghelkund or Rewah, but others of the tribe have spread through Bundelkhand, Allahabad, Benares, Cawnpore, Gorakpur and Furrukhabad.

The *Bandela* is a rajput tribe descended from the Garhwar of Kantil and Khairagarh, who settled in Bundelkhand in the 13th or 14th century and gave their name to that province.

The *Chundel* tribe of Rajputs are scattered in various parts of the North-West Provinces, and for the most part derive their origin from Muhoba, in Bundelcund. Before the mahomedan conquest, Muhoba appears to have been the capital of a principality that extended to the Nerbudda, and included the province of Chunderee, which is called after their name. They are styled Somabunsee, but they are not considered to be of pure descent, and their sons are carefully excluded from marriages with the higher clans. This tribe expelled the Baland tribe from Ajoree, Burhur and Mirzapur.

Near the *Colehan*, there are four rajput chiefs, viz., the rajahs of Mohurbunj and Porahat, the koer of Scraikilla and the thakur of Khursowan.

The *Boondée* ruling family belong to the Hara tribe of Rajputs. They have been elsewhere noticed as Chohan or *Pramara* Rajputs. The first rajah with whom the British Government had any intercourse was Omeda, who gave most efficient assistance to Colonel Monson's army in its retreat before Holkar: he died in 1804, after a rule of upwards of fifty years, and was succeeded by his infant son, Bishen Sing. During the Mahratta supremacy this state suffered much at the hands of Sindhia and Holkar, who virtually assumed the management of the revenues. The territory of Boondée was so situated as to be of great importance during the war in 1817 in cutting off the flight of the Pindaree. Maha Rao Bishen Sing early accepted the British alliance, and a treaty was concluded with him on 10th February 1818. By this, the tribute paid to Holkar and the lands in Boondée held by Holkar, were relinquished to the rajah, who engaged to pay to the British Government the share of tribute he had hitherto paid to Sindhia. In its earlier times, this little state became so connected with the imperial court of Delhi, that, like Jeipoor,

the princes adopted several court customs. The Puthan, or premier, was entitled Dewan and Moosahib; and he had the entire management of the territory and finances. The Foujdar or Killedar is the governor of the castle, the Maire de Palais, who, at Boondee, is never a rajput, but some dhabhae or foster-brother, identified with the family, who likewise heads the feudal quotas or the mercenaries, and has lands assigned for their support. The Buckshee controls generally all accounts; the Rassala those of the household expenditure. Boondee has a beautiful palace.

The Mackeri Rajput in Mewar, were formerly turbulent.

The Guhurwar, also written Gaharwar, is a tribe of Rajputs found in Dera Mungulpoor, Bithoor, Gnjmow, Canouj and Bilhour in the Central Doab. The Guhurwar of K'hara Mungrore in Mirzapoor are converted to mahomedanism, and those of Mahaich in Ghazeepoor are reckoned an inferior branch. The chief of the Guhurwar resided at Bidjypoor, a few miles to the west of Mirzapoor, where the liberality of the British Government enabled him to keep up some show of respectability. At the time of the first occupation of Benares by the British, he was a fugitive from the tyranny and oppression of the Goutum Bhoonhar, who had expelled the Guhurwar family in A. D. 1758. The Guhurwar may be considered one of the most interesting races of the Upper Provinces, yet much obscurity hangs over their origin and lineage. They are recorded among the 36 royal tribes of Rajputs, and are said to be of the same family as the Rathor, with whom it is said they never intermarry.

The Birgujar, one of the 36 royal races of Rajputs, are settled along the Jumna from Rohilcund to Matura; some are mahomedans.

The Dhákura Rajputs are scattered over the country, from the south bank of the Jumna, about Agra, Mathura, across the Doab to Rohilcund.

The Bhál Rajputs are proprietors of lands in Bulandshahar and Aligarh.

The Bachhal Rajputs claim a descent from the Lunar race. They were formerly zamindars of Farida and Shah Jehanpoor, but are now settled in Aligurb, and different parts of Badoun, Mathura and Shah Jehanpoor.

The Hyovansa or Haihaya Rajputs in the Province of Benares, were once a dominant race on the banks of the Narmada, where Mahéswari was founded by Sahasrayuna, a raja who is largely mentioned in the legendary traditions of the hindoos.

The Húryá, a small tribe of Somavansi Rajputs, are dwelling in some parts of the province of Benares.

The Rajputs of the N: Western hills are ethnologically a much purer and finer race than those on the plains, but even they assert that their ancestors came from Ayodia or Oudh.

The Rajputs of the Punjab and adjoining hills are supposed to be not so high on the scale of Rajput orthodoxy as the Solar and Lunar races of Ayodia. One of the grand points on which the hill chieftains pride themselves, is the purity of their descent;—they consider themselves the only true and pure Rajputs in India, and to avoid the mixture of blood, they only give their daughters in marriage to purely descended Rajputs, and would rather condemn them to a life of single blessedness, entailing greater seclusion, and being far more irksome even than the confinement of the convent, than ally themselves by marriage to one of mixed blood, such as an illegitimate child is considered to be. These true-born Rajputs look down upon the chiefs who cannot boast of the same purity of descent; not only will they not intermarry with them, but they will not eat with them, nor permit them to sit in their presence on a footing of equality; the fear of the anger of the British authorities alone obliging the Rajputs to acknowledge, or permit an interchange of common civility, with those they look on as belonging to a mongrel breed.

A rajput, even of the humbler people, has a bold and dignified appearance, and their women are singularly beautiful. Almost all hindus who have taken to soldiering, Mahrattas, aborigines and Jat, claim a Rajput origin. The Rajput and Pathan are valiant and high-minded warriors; but their pride and their courage are personal only, and concern them as men of ancient family and noble lineage; they will do nothing unworthy of their birth, but they are indifferent to the political advancement of their race. The Rajputs are always brave men, and they form, too, a desirable peasantry. The Rajput has an inveterate contempt of the plough, yet multitudes, proud as they are, have been forced, of sheer necessity, to till or die. The tea cultivation in the Kohistan has given employment to many more. The best specimen of the hindu character, retaining its peculiarities while divested of many of its defects, is found among the Rajputs and other military classes in Gangetic Hindustan. It is there we are most likely to gain a clear conception of their high spirit, their enthusiastic courage, and generous self-devotion, so singularly combined with gentleness of manners and softness of heart, together with a boyish playfulness and almost infantine simplicity. In the lower Doab, the Rajput take the hindu royal designations of Raja, Rao, Rana Rawat, and Rawal. Rajput dominions run

south of the Gogra, and thence across the Ganges into the Arrah District (Bojpur). The ranks of the Bengal Native Army were filled with Rajputs, Pathans and Brahmans, nearly all from the provinces of the Upper Ganges, the inhabitants of which have become greatly modified in character by complete conquest and mixture with strangers.

Akbar allied himself with the rajput royal houses, and for a hundred years, high civil and military posts were bestowed on them. But the rajputs were alienated from the moghul family by the bigotted conduct of the emperor Aurungzib, who reimposed the poll tax on hindus, which Akbar had abolished, and by his destroying hindu temples everywhere. The most brilliant conquests of Akbar, Jehangir, and Aurungzib were, however, by their Rajput allies; though the little regard Aurungzib had for opinion alienated the sympathies of a race, who, when rightly managed, encountered at command the Afghan amidst the snows of Caucasus, or made the furthest Chersonese tributary to the empire of Assam. Raja Maun of Jeipoor took Aracan, Orissa, and Assam. Raja Jeswunt Sing of Marwar retook Kabul for Aurungzib, and was rewarded by poison. Raja Ram Sing Hara of Kotah made several important conquests, and his grandson, Raja Essures Sing and his five brothers were left on one field of battle.

The love of country and the passion for possessing land are strong throughout Rajputanah: while there is a hope of existence, the cultivator clings to the bapota, and in Harauti this *amor Patriæ* is so invincible, that, to use their homely phrase, "he would rather fill his part in slavery there, than live in luxury abroad." There are, however, amongst the Rajputs 84 mercantile tribes.

Every Rajput adores Asapoorna, the fulfiller of desire; and as Sacambhari Devi (goddess protectress), she is invoked previous to any undertaking. Amongst the Rajput races, according to Colonel Tod, Har is the patron of all who love war and strong drink, and is especially the object of the Rajput warrior's devotion; accordingly blood and wine form the chief oblations to Har, the great god of the Rajput. The Gossains, and the peculiar priests of Har, or Bal, the sun, all indulge in intoxicating drugs, herbs, and drinks. They are usually seated on a lion, leopard, or deer-skin, their bodies covered with ashes, their hair matted and braided with iron tongs to feed the penitential fires, and their savage appearance makes them fit organs for the command of the god of blood and slaughter. The bodies of these Gossain priests, ministers of Har, the god of war, are not burned like the hindus, but are

buried, and a circular tumulus is raised over the remains; and with some classes of Gossain, are raised small tumuli, whose form is the frustrum of a cone, with lateral steps, the apex crowned with a cylindrical stone.

A Rajput never names his wife. The influence of women on Rajput society is marked in every page of hindu history, from the most remote periods. What led to the wars of Rama? the rape of Sita. What rendered deadly the feuds of the Yadu? the insult to Drupdévî. What made prince Nala an exile from Nirwur? his love for Damyanta. What made raja Bhirttri abandon the throne of Awinti? the loss of Pingani. What subjected the hindu to the dominion of the mahomedan? the rape of the princess of Canouj. In fine, in Hindustan as elsewhere the cause which overturned kingdoms, commuted the sceptre to the pilgrim's staff, and formed the groundwork of all their grand epics, is woman. Nevertheless, up to their latest wars, the Rajput opponents strove to humiliate each other by obtaining possession of their women, and the desire to avow this often led to the destruction of whole families, the women and children being destroyed by poison or the sword, and their male relatives rushing in despair on the foe. This destructive act was termed *johur*. When the foe was the Tartar, the *johur* might have been pardonable, but the practice was common in the international wars of the Rajputs; and there are numerous inscriptions on stone and on brass, which record as the first token of victory the captive wives of the foeman. When the mother of Sisera looked out of the window, and cried through the lattice, why tarry the wheels of his chariot, have they not sped? have they not divided the prey, to every man a damsel or two? her conduct gives a perfect picture of the Rajput mother expecting her son from the foray. The Jewish law with regard to female captives was perfectly analogous to that of Menu; both declare them "lawful prize," and both Moses and Menu establish rules sanctioning the marriage of such captives with the captors. "When a girl is made captive by her lover, after a victory over her kinsman," marriage "is permitted by law." The forcible marriage in the hindu law termed *Rachasa*, viz., "the seizure of a maiden by force from her house while she weeps and calls for assistance, after her kinsman and friends have been slain in battle," is the counterpart of the ordinance regarding the usage of a captive in the Pentateuch, excepting the "shaving of the head." Malli and Noé, gardeners and barbers, are important members of every Rajput family, and are to be found in all the

villages, of which they are invariably the cooks. The letter A, to the Rajput of the north-west, is as great a Shibboleth as H is to the Cockney :—thus Appa becomes Cappa.—*Annals of Indian Administration. Tod's Rajasthan, Vol. I., pp. 1, 2, 77, 195, Vol. II., pp. 122, 202, 287, 290, 307, 309, 345, 356, 425, 450, 504. Tod's Travels, pp. 49, 54. Milner's Seven Churches of Asia, p. 100. Layard's Nineveh. Burton's Sindh, pp. 378, 393. Elphinstone's History of India, p. 375-376. See Astarte; Ashtoreth; Baal, High Places, India; Ken; Sundhya; Sundevan.*

RAJ SUMUND, a stupendous work of marble, with an adjacent causeway, dams the lake of Rajsumund at Kankerowli. The structure cost upwards of a million sterling. The spectator who views this royal sea or *Rajsumund* on the borders of the plain; the pillar of victory towering over the plains of Malwa, erected on the summit of Cheetore by rana Mokul; the palaces and temples in this ancient abode, the regal residences erected by these princes, must be filled with astonishment at the resources of the Mewar state. They are such as to explain the metaphor of Zalim Sing, who said 'every pinch of the soil of Mewar contains gold.'—*Tod's Rajasthan, Vol. I., p. 224.*

RAJ TARINGINI, a work by Vedyadhar, it gives the various dynasties who ruled at Indraprastha or Dehli, from Yudishtra to Vicramaditya. It was compiled under the eye of Bowni Jey Sing of Amber.

RAJUN, HIND. *Mimusops hexandra.*

RAJUR, a Rajput tribe said to be of Bhatti descent, they confine their haunts to the desert, or the borders of Jeysulmeer, as at Ramgurbh, Keallah, Jarallah, &c., and the t'hul between Jeysulmeer and Upper Sind; they are cultivators, shepherds, and thieves, and are esteemed amongst the very worst of the converts to mahomedanism.

RAJVANSA. See *Infantieide.*

RAJ VULA, the chronicle of the reign of Raj Sing, a prince of Mewar.

RAJWAR, outcast labourers of Bengal and Bahar.

RAJWARA. The territory of the raja of Kutch Bahar in Rungpur. Here, when the means of individuals prevent them from cultivating their own lands, it is not uncommon to hire out the whole with men and implements; for the use of which one-eighth of the produce is the established consideration.—*Tod's Rajasthan, Vol. II. p. 542.* See Kattyawar.

RAJYUGNI. See Kunjuna.

RAK. DUT. Arrack.

RAK. SIAMESE. The tree which produces the beautiful varnish valued in the lacquer ware of China.

RAKAIGAL. TAM. Feathers.

RAKAL. HIND. of Kulu. *Taxus baccata.*

RAKAM. AR. HIND. A kind of enumeration used at mahomedan courts and by the Kayast'h by the initial letters of the Arabic words, for the numbers. See Raqam.

RAKAT-CHANDAN. BENG. and HIND. *Pterocarpus santalinus.*

RAKCHAM. See Kunawer.

RAKH. HIND. In the Panjab, an uncultivated or waste tract, bearing grass, firewood and stunted jungle of Capparis, dhak, jband, &c.; also a reserved plantation, a shikargah, a rund, a chuk. Tracts of "rakh," are to be met with in portions of many districts of the Panjab. In the Lahore district there are no less than 86 such tracts, consisting of plots of uncultivated ground; the total area is 2,50,000 acres, but not all of this yields wood, a great deal is grazing ground, much of which is quite capable of being brought under cultivation. The great value of the wood bearing rakhs consists in their being the source from which all the fuel for railway consumption is to be taken. Not only is the upper growth of wood valuable in this way, but the roots that remain in the soil after the stunted growth has disappeared from the surface are equally capable of being utilized.—*Powell's Hand-Book, Vol. I., p. 549.*

RAKH. HIND. Ashes.

RAKHA. HIND. A watcher or watchman.

RAKHAING, a race occupying Arracan, towards the embouchure of the Koladyn river, having the Sak, Kumi and Khyen on their north-east and south. A settlement of Rakhaing has been made on the Tenasserim coast in L. 98 E. from Lat. 13° 40' to 14° 30' E., east of the Moscos islands. They are a branch of the Burmese who separated themselves from the main stock at a very early period. The people of India call them Mug, a name of unknown origin and unknown to the Rakhaing themselves. The Mug are a highly Bengalised class of Rakhaing. They call themselves Myama-gyi or great Myama. They give their name to Aracan.

Bom-zu or Bunzu, called also Bondu, are a tribe of the Rakhaing, who dwell north of the Kaladyn river. They have, on their north, the Lungka, Kungye or Kuki in the highlands of Tipperah. The Bomzu and the Kuki seem to belong to the Burman race. The seaboard and the lower portions of the valleys opening into it, form the country of the Ra-Khoung-tha or Arracan tribe, of whom the Burmans are a branch. Some are found residing on the banks of the mountain streams, and are distinguished by the name of Khyoung-tha. Their language proves that they do not belong to the Yuma group, but are intruders from the north; and their own traditions recognize the Ku-mi as the tribe in possession of the seaboard, when they entered Arracan.

The Mrung, in the upper basin of the Mayu and towards the hill frontier of Chittagong, are a colony imported from the Bodo country by the kings of Arracan, at the period when their conquests extended far up eastern Bengal.

On the south of Assam is the prominent Burmese race, who profess buddhism, and south of them the British province of Pegu containing Burmese. Mon, also called Talieng, Khe Karen, Kareni or Red Karen, the Khyen, whose women tattoo their faces, the Yet Baing on the Yoma range, and the Shan who form separate communities.—*Mason's Burm.*, p. 62.

RAKKHAL. HIND. of Chamba and Beas, *Taxus baccata*, common yew.

RAKKHAL PHAL. HIND. *Schmidelia ser-rata*, D. C.

RAKKHAL-SUSHA. BENG. *Karivia umbellata*.

RAKKHI. HIND. A kept woman.

RAKHI, an amulet placed by a Rajput woman round the wrist of a man to adopt him as a brother. The Rakhi festival, is held on the last day of Sawun, and was instituted in honour of the good genii, when Durvasa, the sage instructed Salone (the genius or nymph presiding over the month of Sawun,) to bind on rakhi, or bracelets, as charms to avert evil. The ministers of religion and women alone are privileged to bestow these charmed wristbands. The ladies of Rajasthan, either by their handmaids or the family priests, send a bracelet as the token of their esteem to such as they adopt as brothers, who return gifts in acknowledgment of the honour. The claims thus acquired by the fair are far stronger than those of consanguinity. Sisters, also, present their brothers with clothes on this day, who make an offering of gold in return.—*Tod's Rajasthan*, Vol. II., p. 697. *Wilson*.

RAKKA. See Mesopotamia.

RAKKA, a race in the islands of Flores. Flores, called also Endie or Mangerye, is an extensive island of the Archipelago, 201 miles long from E. to W., and from 42

to 45 miles broad. It is named Flores from the Portuguese word 'flor,' a flower, but is called Ende and Mangerye, from its chief south and west ports. Its chief trade at Ende is with Sumba or Sandalwood Island; the Mangeraï port trades with the Bugi and Malay. The coast is occupied by the Malay or brown race, but in the interior is a people with frizzled hair, and a similar frizzled hair people live in the mountainous parts of Solor, Pinta, Lombok and Ombay. On the south coast of Flores is a tribe called Rakka, who are reported to be cannibals, accustomed to eat their enemies and their own relatives who die. Captain Keppel says that the natives captured from the island used to be much esteemed by the Celebes pirates, as slaves, and he gives the following translation from a Dutch journal:—"On the island of Flores, there lives a race called, on the south coast, Rakka, who not only devour their enemies, but with whom custom requires that the son shall eat the body of his deceased father in pieces, and sell the flesh to the inhabitants at the high price of its weight in gold. This flesh is greedily eaten by the people as a great delicacy. If the father was heavy and of great size, the son considers himself particularly fortunate. The population of Endore on the same island is also very greedy of human flesh. But these cannibals confine themselves to the heart, which, with incredible dexterity, they extract from the body, by giving a blow under the left shoulder-blade. It is then cut into very small pieces, eaten completely raw by the bystanders, who belong to the same race." Captain Keppel adds, "I am not able to corroborate this."

Galeteng is a locality in the island of Flores, occupied by a race so called. According to the statements of Bugi traders, who had settled in Flores, that island is inhabited by six different races, speaking as many different languages, the Ende, the Mangarai, the Kio, the Roka, the Konga and the Galeteng, names derived from the principal places of their residence.—*Horsburgh. Bikmore, Keppel's Ind. Arch.*, Vol. II., p. 149. *Crawford's Dict.*, 1, p. xciv. See India.

RAKKISA TUNGA. TEL. *Cyperus Roxburghii*, *Nees*.—C. Watus, R. i. 204.

RAKSHANI. See Kelat.

RAKSHASA, a term applied by the Aryan intruders into India, to the inhabitants whom they found settled there. In the present day, according to the hindu superstitions amongst the evil genii of all India, is a being called Rakshasa, of giant bulk, terrible teeth, who feasts on dead bodies, a spirit or demon who appears to be of various descriptions. As a kind of Titan, or enemy of the gods, of the hindu mythology, he assumes a gigantic

superhuman form, after the manner of Ravana and others. He is sometimes represented as the guardian of the treasure of Kuvera, the god of wealth; and sometimes as a cannibal, imp or goblin, haunting cemeteries, devouring human beings, impeding sacrifices, and disturbing religious people in their devotions. In this last named character, the Rakshasa appear to have waged continual war with men, as the Daitya or Danava did with the gods. The European of the nineteenth century cannot realize the dread in which the hindoo stands of devils. They haunt his paths from the cradle to the grave. The Tamil proverb in fact says: "The devil who seizes you in the cradle goes with you to the funeral pile." The chief anxiety of the Tamil father when his child is about to be brought into the world, is to see that the leaves of the Margosa tree are carefully fixed over the threshold to prevent the devils from entering and seizing upon the child at the moment of birth. If he have lost two children before, and this be a son, a bracelet is placed upon the child's arm as a safeguard, a golden ring is fixed in its nose, and it is solemnly dedicated to some particular demon who is entreated to protect it. The child is then perhaps named *Payen* (the Devil's own,) a name of frequent occurrence in South India. The ring is allowed to remain in the nose till the child is grown, a great feast is then made by the parents, and sacrifices of sheep or cocks offered at the shrine of the tutelary demon. The periods of marriage and pregnancy are times at which devils are supposed to be especially malignant, and ceremonies are then performed to avert the influence of the evil eye, ill-omens and devils. In so slight a matter as the boring of a child's ears for ear-rings, it is considered necessary to propitiate Karuppan with the sacrifice of a goat, or a cock at least. A person seeing a crowd assembled under an Odiya tree (*Odina pinnata*) which the massive iron chain hanging from its trunk betokened to be dedicated to Karuppan, he rode up, and found there the quivering body of a ram just sacrificed to the demon. The head had been severed from the body by one blow of a large sickle-shaped weapon, which was courteously handed for inspection. It was made, handle as well as blade, of native iron, and had lately been presented to the shrine by a devotee. The sacrificer had made the present offering on the auspicious occasion of an infant son having his ears bored. The head of the ram fell, as usual, to the share of the officiating priest, while the body slung on a pole and carried on the shoulders of two men, amid the beating of tom-toms was taken home to furnish the evening feast. No temple was near, but on a pedestal under the tree, reposed a hideous object made of pot-

ter's ware. This particular demon is supposed to be, when propitiated, very liberal in the bestowal of benefits; and the pujari mentioned to the looker on that if he would make a sacrifice of a goat or two, he would guarantee that his devil should obtain for him a lucrative appointment under Government! The sacrifices of goats is almost continuous:—sometimes as many as twenty goats are sacrificed at one time. The flesh is generally cut up, cooked and eaten on the spot; and round the shrines may often be seen a number of small earthen ovens. The strongest oath a sudra can take is to swear by the most famous devil of the district; and, often before a law suit is carried into court, the aggrieved party will say to his opponent,—“I will be satisfied, if you will go to such a demon's shrine, and there, on the justice of your cause, blow out the flame of a lamp in the presence of the Kali.” A man who would not hesitate a moment to commit perjury in Court, would never dare to perform this ceremony knowing his cause to be unjust, for then he firmly believes that he would immediately be stricken down by the demon. So swears Latinus in the *Æneid* :—

“*Tango aras, medios ignes et numina testor.*”— | Under this ever-present fear of demons, the hindu often hesitates to go even a hundred yards in the dark; he will not enter a forest alone; he fears to stand on the borders of a lonely lake, for there dwells the spirit which in Scotland is known by the name of the Kelpie, and it is near the water where, he has heard, may be often seen in the darkness of the night, the “fiery-mouthed devil,” *Ignis fatuus*. But most of all, he fears the sandy plain, for it is a notion thoroughly oriental, that the unclean spirit “walketh through dry places,” which are called in Tamil *Pay Kadu*, “Devil deserts.” Devils are especially said to abound in the sandy wastes between Madura and Tinnevely, where the mirage (in Tamil *Pay Ter*, the Devil's chariot), is frequently seen, and is said to be produced by them. When a fire takes place in a village, it is owing to the wrath of the village-devil. His worship has been neglected, or some insult has been offered to him and he thirsts for revenge. Near the village of Vedarapuram in the Tanjore district, for about four or five years accidental fires had been of annual occurrence, and it was commonly reported to be owing to the anger of *Aiyandar*, a demon whose shrine is situated to the west of the village. A banyan tree near the spot dedicated to him, was some years ago, felled without his permission, and since that time, the enraged demon, refusing to be propitiated by the usual sacrifices, yearly burned down a house or two. Many races, besides hindus, are very prone to make vows in time of sickness. Formerly we

are told, people used to go from all parts of England to Canterbury—

"The holy blissful martyr for to seek,
That them hath holpen when that they were sick."

The hindu makes a vow to go to a particular shrine, and there pour offerings of oil and spices. If a diseased member have been restored, oftentimes a golden image of it is made and presented to the shrine. A person suffered from a serious affection of the eyes. A vow was made that in case of recovery, two golden eyes should be made and presented to the shrine of Mari Amman. In like manner, the Philistines, we read, when afflicted with emerods, thought, after consulting with their soothsayers, that they could best propitiate the God of Israel by making and offering to him, golden images of the emerods. As may be expected the devils are most busy in the

"last scene of all

That ends this strange eventful history;"

and a young girl fears to cross a dying man lest his latest breath should pass into her in which case she would be possessed beyond recovery. For a similar reason, a hindu at the point of death is always removed to expire without the house, which would otherwise be haunted. As the corpse is carried away, parched rice is scattered along the route of the funeral procession. It is believed that the devils will stop to pick it up, and it is considered advisable to keep them so engaged till next sun-rise, for should they return to the house before that time they would probably not be satisfied without another victim. A native proverb says:—"A Saturday's corpse goes not alone," when, therefore, a death takes place on a Saturday, to prevent evil consequences, a live cock is taken with the corpse to the burning ground, and it is there given away to some person of low caste, or like the scape-goat of old, allowed to escape into the adjacent jungle. Brahmins, averse to bloody sacrifices, substitute for a cock, the bolt of the door of the house, which they burn with the corpse. When a dead body is *buried*, instead of being burnt, as in the case of suniyasi (*wandering devotees*) salt is placed in the grave, and frequently with it the leaves of the margosa tree so famous as a charm against devils. Salt was till recently also in England placed on the corpse of the Roman and Lutheran christians, for the avowed purpose of keeping it secure from the evil one, and the practice is still said to linger in the Highlands of Scotland. It was seen in 1833, placed over the dead body of a young girl at Greenwich. The Highlanders indeed in many of their superstitions are remarkably similar to the hindus. They formerly planted the rowan, or mountain-ash, regarding it as a safeguard against devils,

just as the hindus regard the margosa. Through out India, the belief is as common as it was formerly in Europe, that a man who dies a sudden or a violent death, becomes a demon. All the women in the district are immediately possessed by him, and innumerable mischiefs result. A brahman accidentally drowned in the river Kaveri about the year 1870, became in consequence a "Brahma Rakshasa" one of the fiercest of demons: an officer of Artillery killed at the battle of Assaye, was buried beneath a tree near the village and his spirit is worshipped there to the present day. Dr. Caldwell mentions the case of an English officer mortally wounded at the taking of the Travancore lines in 1809, who was afterwards worshipped as a demon,—cigars and spirituous liquors being added to the usual offerings made in such cases. A few years ago a brahman who was sentenced to be hanged at Madras for the murder of another brahman, going on pilgrimage from Benares to Rameswaram, threatened that though they were about to hang him, he would not die, but would become a Brahma Rakshasa and torment all those who had given evidence against him.

Bells and chains are almost always used in devil-worship and exorcism; the notion involved seems less to be that of scaring the devil, than that of charming him, just as a snake-charmer charms a snake by music. Near the fane of the popular devils, there are massive iron chains hanging from the trees, with bells and knives attached to them. In the well-known Sanskrit work, the *Hitopadesa*, occurs a story relating to a famous devil called *Ghanta-karna* or Bell-ear. This Rakshasa was believed to dwell on the top of a mountain near the town of Brahmapura. One day, a thief having stolen a bell (probably one of those near the demon's fane), was killed by a tiger, as he was carrying off his plunder. The monkeys who dwelt in the adjacent forest obtained the bell and amused themselves by ringing it. The people of the town having found the dead body of the man and continually hearing the sound of the bell were filled with intense horror fully believing that the demon, enraged, had killed the thief, and was now ringing the bell. The town was in consequence nearly deserted, when an old woman guessing the truth, went to the king and said that for a small sum she would undertake to settle the demon. The king, delighted, gave her what she asked, and the old woman after tracing the cabalistic circle,—(*the Kolam*) and pretending to go through certain incantations, entered the forest. By means of fruits which she strewed on the ground, she was enabled to decoy the monkeys, and having obtained the bell as a trophy of her victory over the demon, she returned in triumph

to the town. So little has the belief in devils been shaken, that in the India of the present day, it would, in a like case, be just as easy to deceive the people and even their native hindu rulers — *Williams Story of Nala*, p. 208.

RAKT. SANS. Blood.

RAKTA-BALI. Blood offering, a blood sacrifice to an idol. The blood sacrifice of the hindus. See Bali; Hindu.

RAKTA-CHANDANAM, also Rakta-gandham, and Ku-chandanam. TEL. *Pterocarpus santalinus*.—*Linn.*

RAKTA CHANDAN. HIND. *Adenanthera pavonina*, also *Pterocarpus santalinus*.

RAKTA-KANCHAN. BENG. *Bauhinia variegata*.—*Linn.*

RAKTA KRISHNA CHANDANAM. TEL. *Santalum album*, *L. Hari chandana* W. Fine old sandalwood of a deep yellow or red color with a brown heart.

RAKTIKA. SANS. Seeds of *Abrus precatorius*.

RAKTJAPA. HIND. Red Hibiscus.

RAKT-KANER or karbir. HIND. *Nerium odorum*.

RAKTO CHANDAN. BENG. *Adenanthera pavonina*.—*Linn. Willde.*

RAKUS. HIND. *Agave Americana*.—*Linn.*

RAKUS TAL or Tso Lánag, the Salt Lake in L. 30° 29', L. 81° 10' (referred to Lágan Tánkan, on its southern border), in Gnári Khórsum, is 15,250 feet above the sea.—*Strachey.*

RAL. HIND. of Murree Hills, &c. *Mimosa rubicaulis*.

RAL. DUK. GUZ. HIND. Dammar, resin, rosin. Ral, also Rala, is a general Hindi term for all resin-like substances. The white rosin is the safed ral from the *Shorea robusta*. The black and yellow rosins are called kala ral and zard ral. Sir Richard Jenkins states in his report on the Nagpore territory, that the Ral or rosin tree, as also other large wood, is obtained in the forests of Kakir (probably Conkir), and in the hills north of Iluttenpore. When Captain Sankey visited the Pachmurra range, Dr. Jerdon and he met with the "Vatica tumbugaia" which is probably Sir R. Jenkin's Ral tree, though it does not seem in those jungles, to attain a large size.—*Captain Sankey.* See Resins.

RALA. DUK. *Panicum italicum*. *Linn.* *Setaria Italica*. See Millet.

RALI. HIND. Red powder from fruit of *Rottlera tinctoria*.

RALLIDÆ, a family of birds :

SUB. FAM. GALLINULÆ.

Porphyrio polycephalus, *Lath.* The purple coot.

Fulica atra, *Linn.* The bald coot.

Gallinex cristatus, *Latham.* The water cock.

Gallinula chloropus, *Linn.* The water hen.

„ *burnesii*, *Blyth.* Small water hen.

Gallinula phœnicura, *Pennant.* White breasted water hen.

Podaca personata, *Gray.*

zeylonica, *Gmel.* The banded rail.

striatqs, *Linn.* The blue breasted rail.

indicus, *Blyth.* The Indian water rail.

japonicus, *Schlegel.*

Crex pratensis, the corn crane.

RAM. HIND. A hindu incarnation of a deity.

RAM-RAM. A hindu salutation, equal to the salam alaikaian in use amongst mahomedans.

RAMA, now a deified warrior, was the leader of one invasion of the southern part of the Peninsula of India, and of Ceylon, and his inroad seems to have been a great occasion of breaking up and scattering the races in the east of the Peninsula. He advanced into the forests of Dandacaranya, scattering the prior inhabitants, as he advanced, whom he described as rakshasha or demons, driving some of them into the forests and mountain retreats where they still reside in a barbarous freedom, and reducing others to a state of predial slavery, in which, the pariah, the pallar, cherumar and other humbled races are now dwelling in the plains. To such invasions is owing the circumstance that each province in India has its own peculiar helot races; and each range of mountains and each forest tract, its own tribes of wild savages either wholly independent or partially subject to their more civilized neighbours in the open country. In a period of anarchy two heroes are made to appear in India, to punish the wicked and the proud. The first of these is Vishnu, whose efforts seem to have been general, but the next warrior was Rama, also called Parasarama, who directed his power against the ruling chiefs. Vishnu is represented as the founder of the Indian kingdoms as far as Pandea on the south. Bunsen, (iii. 562,) regards this legend as an expression of the belief in the moral government of the world, similar to that in the hymns of the Rig Veda, where Varuna punishes sin by disease and death, but Indra destroys the wicked. From Ikshwacu to Rama, of the Sooryavansha or race of the sun, was a period of 1200 years. Rama preceded Krishna; but, as their historians Valmiki and Vyasa, who wrote the events they witnessed, were contemporaries, it could not have been many years.

Rama, of the solar line of hindu chronology, is however placed by the brahmaus 867103 B. C. between the silver and brazen ages, but was brought down by Sir William Jones to B. C. 2029 and reconciled to the Rama of scripture. Rama's brothers were Lakshmana, Bharata, and

Setroghana, but he is variously supposed to have lived B. C. 2029 years, Jones ; 950, Hamilton ; and 1100, Tod. Rama, son of Dasaratha, according to Bentley, was 1 year old in 960 B. C.

From Rama, all the tribes termed Suryavansa, or 'Race of the sun', claim descent, as the present princes of Mewar, Jeipoor, Marwar, Bikaner and their numerous clans ; while from the Lunar (Indu) line of Budha and Krishna, the families of Jey sulmer and Cutch (the Bhatti and Jareja races), extending throughout the Indian desert from the Sutlej to the ocean, deduce their pedigrees. Rama was a king of Oude, and is almost the only person mentioned in the hindu traditions, whose actions have something of a historical character. He is said to have been at first excluded from his paternal kingdom, and to have passed many years in religious retirement in a forest. His queen, Sita, was carried off by the giant Ravana ; for her sake he led an army into the Deckan, penetrated to the island of Ceylon, of which Ravana was king, and recovered Sita, after a complete victory over her ravisher. In that expedition his allies were an army of monkeys, under the command of Hanumán, whose figure is frequently seen in temples, and who, indeed, is more worshipped in the Deckan than any of the other gods. Ráma's end, however, was unfortunate, for, having, by his imprudence, caused the death of his brother Lachmana, who had shared with him in all his dangers and successes, he threw himself, in despair, into a river, and, as the hindus says, was reunited to the Divinity. He still, however, retains an individual spiritual existence, as is shown by the separate worship so generally paid to him. Rama is represented in his natural form, and is an object of general adoration. But in this respect he falls far short of history, which when stripped of its fabulous and romantic decorations, merely relates that Rama possessed a powerful kingdom in Hindustan ; and that he invaded the Deckan and penetrated to the island of Ceylon, which he conquered. Sir William Jones places the subjugation of India by Rama about the year 2018 B. C. Mr. Bentley, after a much more accurate research, fixes his birth on the 6th April of the year 961 B. C. In his time and that of his father Dasaratha, astronomy was much cultivated ; and it is supposed (not without much probability) that the first Astronomical Tables for computing the places of the planets were constructed on the observations made in Rama's time. There was an eclipse of the sun on the 2nd of July of the year 940 B. C. which according to Mr. Bentley, may be referred to with certainty, as an epoch of Rama's reign. Rama married Sita, daughter of raja Janaka. He gained her by breaking the

great bow, their stories are told in the Ramayana.—*Prinsep, p. 215. Elphinstone's History of India, Vol. I, pp. 103, 104, 389. Ed. Warren, Kala Sanhita.*

RAMA, among the avatara of Vishnu, in the mythology of the hindoos, are recorded three favoured personages, in whom the deity became incarnate, all named Rama. They are distinguished by the names of Bala Rama, usually called Balaram: Parasu Rama, or Parasaram, meaning Rama of the club, and Rama Chandra, and are all famed as great warriors, and as youths of perfect beauty.

The first named, Bala Rama, was elder brother to Krishna, and greatly assisted him in his wats ; so that, in this instance, Vishnu seems to have duplicated himself, as indeed may be also said of the other, for Parasu Rama, and Rama Chandra, otherwise called, patronimically, Dasrat Rama, were contemporaries. But it has been made a question, whether they be not three representations of one person, or three different ways of relating the same history : and, whether any, or all of them, mean Rama, the son of Cush, Sir W. Jones says he leaves others to determine. He deems Rama, son of Dasaratha, to be the same as the Grecian Dionysos, who is said to have conquered India with an army of Satyrs, commanded by Pan ; and Rama was also a mighty conqueror, and had an army of large monkeys, or satyrs, the general or prince of whom was Hanuman, a name said by this author to mean with high cheek-bones ; others translate it, with bloated cheeks, alluding to his fabled origin from Pavan, regent of the wind. Rama is also found to resemble the Indian Bacchus ; he is a descendant of the sun, and the husband of Sita ; and it is very remarkable, that the Peruvians, whose Luca boasted of the same descent, styled their greatest festival Ramasitoa. Krishna, describing himself to Arjun as the first of all things, says, " Among those who carry arms, I am Rama."

The following passage taken from the 'Ut-tara Rama Cheritra,' affords an idea of the costume of the warrior race in ancient times Janaka, the father of Sita, the heroine, is describing the hero, Rama :—

' You have rightly judged
His birth : for see, on either shoulder hangs
The martial quiver, and the feathery shafts
Blend with his curling locks. Below his breast,
Slight tintured with the sacrificial ashes,
The deer-skin wraps his body, with the zone
Of murva bound ; the madder-tinted garb
Descending vests his limbs ; the sacred rosary
Begirts his wrists ; and in one hand he bears
The Pipal staff, the other grasps the bow.
Arundati. Whence comes he ?

Of Parasu Rama it is related, that he was born near Agra, in the Tirtya yug, or second

age. His parents were Jamadagni, whose name appears as one of the rishi, and Runeka. He seems to have been a warrior prince who about B. C. 1176 over-ran the Malabar Coast and introduced an Aryan race from the north; and gave his name to an era used still on the Malabar Coast from Mangalore to Cape Comorin. The term Parasa, means a club, and was probably applied to him from his carrying a mace.

Rama Chandra.—In this avatar, Vishnu appears in the person of a courageous and virtuous prince, the son of the powerful sovereign of India (whose capital, *Ayodhya*, is said to have extended over a space of forty miles) to punish a monstrous giant, Ravan, who then reigned over Lanka or the island of Ceylon. The Ramayana contains the heroic description of the battles and lives of all three Rama, although it more particularly details the exploits of Rama Chandra, or Dasarath Rama, so distinguished from his royal father Dasarath'ha. The name of this heroic monarch means, whose car had borne him to ten regions, that is, to the eight cardinal and intermediate points, the zenith, and nadir. He was a descendant from Surya, or Heli, which is a name of the sun in Greek and Sanskrit; and one of his ancestors, the great Raghu, had conquered the seven Dwipa, or the whole earth. But we cannot explain, why a Suryavansa, or descendant of the sun, should be styled Rama Chandra, the latter patronimic referring contra-distinguishingly to the descendant of the moon, Chandravansa. In the hindu mythology, however, everything seems, directly or indirectly, to merge in, radiate from, or amalgamate with, the sun, or Surya, in one or other of its names, or prototypes. All of the vaishnava sects and tribes hating such deistical philosophers as sceptically deny the personal existence of inferior deities, attributes, or avatars, agree in stating, that, with the exception of Krishna, the potentiality of the preserving power of the deity was never exhibited in such plenitude as in this avatars of Rama. In popularity and in dramatic, historic, and poetic shapes, it rivals the avatars of Krishna. And as the Gocalastha sect adore Krishna as the deity himself, and draw rules for their religious and moral conduct from the Sri Bhagavata, so the sect called Ramanuj similarly clothe Rama in almighty attributes and deem the Ramayana a complete body of ethics and morality.

For Bala Rama, see Krishna; Jaganath; Vishnu; Mahabharata.

For Rama, son of Dasaratha—see Avatar; Hindu; Ramayana; Inscriptions; Osiris; Nath; Narayana; Kuvera; Vahan; Vishnu; Ramesseram Polygamy; Suryavansa; Kush; Ravana; Saraswati; Sita,,

For Ramachandra, see Avatar; Ramanandi; Ramawut; Inscriptions; Kshetrya.—*As. Res. Vol. ii. p. 132; Vol i. p. 426; Vol. iii. p. 68. Gita, p. 86. Coleman. Moor.*

RAMA, son of Cush, who invaded India, is supposed to be Bacchus or Dionysos, of the Greeks. See Bacchus.

RAMACUAM. *Andropogon schoenanthus.*

RAMACHANDRA BHOJA. See Inscriptions.

RAMA CHANDRA DEVA. See Inscriptions, p. 393.

RAMAGRAMA. See Topes.

RAMA SARAM PALA. See Kanta Bhaja.

RAMAH, called by the natives Ramla, is situated in a fertile plain, that formerly belonged to the Hebrew tribe of Ephraim. It is supposed to be the same as the ancient Arimathea, to which that Joseph belonged, who having begged the body of Jesus from Pilate, took it down from the cross, wrapped it in linen cloth, and laid it in his own new sepulchre. The monks there have a tradition that their chapel is built on the site of the house wherein he dwelt.—*Robinson's Travels in Palestine and Syria, Vol. I, p. 28.*

RAMALINA FURFURACEA. Angola weed.—*Simmonds' Com. Product, p. 486.* See Dyes.

RAMANAND, a reformer of Benares, about the end of the 14th century, a follower of the tenets of Ramanuj. He founded a sect: he instituted no nice observances, he admitted all classes of people as his disciples, and he declared that the true votary was raised above mere social forms, and became free, or liberated. Kabir is said to have been the son of a virgin widow of a brahmin, her father was a follower of, and was paying a visit to Ramanand. Unaware of her condition, Ramanand wished her to the conception of a son, which occurred, but ashamed of her condition she bore the child in private and exposed it. It was found and brought up by a weaver and his wife. Kabir is said to have been originally styled Inyani, the knowing or wise. He died at Magor near Garakhpur, which was endowed by Mansur Ali Khan with several villages.—*Wilson's Hindu sects.* See Dadu-Panthi; Khaki; Kubeer; Sena-Panthi; Hindoo; Vairagi; Vaishnava.

RAMANANDI or Ramawat, a hindoo sect of whom professor Wilson gives two accounts. In his Hindoo Sects, he says that they are usually considered a branch of the Ramanuja sect of vaishnava, and address their devotions particularly to Rama Chandra and the divine manipulations connected with Vishnu in that incarnation, as Sita, Lakshmi and Hanuman. He is said to have been the fifth spiritual successor from Ramanuja, but he is more

likely to have lived later than this, being in the end of the 14th or beginning of the 15th century. He resided at Benares, at the Pancha Ganga Ghat. They worship Vishnu as Rama Chandra. The sect reverence all the incarnations of Vishnu, but they maintain the superiority of Rama (hence their name Ramawut) in this Kaliyug age. They worship, singly or collectively, the male and female members of this incarnation, or of Rama and Sita, jointly and singly; or of Sita Rama. In his Glossary, however, Professor Horace Hayman Wilson says, the Ramanandi are a sect of vaishnava ascetics, who dwell in Math or monasteries. They are followers of Ramanand, who, about the end of the 13th century taught the especial worship of Rama. They are particularly numerous about Benares. *Wilson's Hindoo Sects.*—*Wils. Gloss.* See Hindoo; Ramanand; Vairagi.

RAMANDROOG or Raman Mulla, a hill 87 miles west from Bellary about $1\frac{1}{2}$ mile long, $\frac{1}{4}$ of a mile broad, and 3,190 feet above the sea level. It is in L. $15^{\circ}7'$; L. $76^{\circ}29'$. In 1846, Drs. Macdonald, Godfrey and Balfour reported on it as a sanitarium, the latter unfavorably. A few officers and soldiers visit it in the hot weather, but as it is subject to the S. W. monsoon like Mahabaleshwar, Chikaldah and other hills it is always deserted early in June.

RAMAN PAAJ. The native name of the Great Bassees.

RAMANUJA, a vaishnava philosopher, the founder of the so-called Visishtadwaita system. The Ramanuj, are worshippers of Ramachandra, and are subdivided into three sects:—

1. Worship Rama only.
2. Worship Sita only as his Sacti.
3. Worship both Rama and Sita conjointly.

The followers of Ramanuja Achary in Mysore, still are to be seen as a separate class speaking Tamil in their families, and Carnataca in public.

RAMA PHALAM. TEL. *Anona reticulata*.—*L.*

RAMA SITA MARAM. TAM. *Anona reticulata*.

RAMA SITOA, a title of the Inca of Peru. See Rama.

RAMASWARA USTI, or Kasi ueste. TEL. *Solanum pubescens*.—*Willd.*

RAMASAWMY, a hindu name very common in the south of India; a silver cigar lighter.

RAMA TULASI. TEL. *Ocimum gratissimum*, *L.*—*R. iii.* 17—*s.* 86.

RAMAYANA, the oldest of the two great epic poems of the hindoos in which the principal hero is Rama. Three versions exist of this book, one supposed to have been composed by Valmiki, one by Tulsi Das, one by Vyasa. That of Vyasa is known as the Adhi-Atma

Ramayana. The story of the Ramayana has some resemblance to that of the Iliad. Sita the beautiful wife of the hero Rama is carried off by the giant Ravana to the island of Lanka or Ceylon whither Rama follows him, and after a variety of adventures recovers his spouse. The reef across the straits of Manar is called Rama's bridge, and the legend goes that he threw the rocks which compose it into the sea. The bare story of each epic is probably historical. Bentley assigned the Ramayana to the fourth century of our own era. The Ramayana gives the exploits of Rama, and the Mahabharata gives the narration of the great Kaurava war. The scene is laid in Oude, but the subject is the conquest of the parts then conquered and pertaining to brahminic India, and of the Island of Ceylon. With its other subjects, the Ramayana describes the forest or wilderness of Dandaca as covering the whole extremity of the southern peninsula, and the rude inhabitants are designated Rakshasha (monsters) or vanara (monkeys); the former meaning races or tribes hostile to the Arians. The word vanara is from vana a wilderness, and nara a man, that is a wild or uncivilized man, and to this sense as to the wild races in the extreme south, the fable of Hanuman, the chief monkey and that of his army, Mr. Taylor thinks may be reduced. He says that those who have seen the Collieri and Marava will readily consider them to differ from all family likeness of the Arian hindus, and as their visages often resemble baboons more than men, it would require even less than the ardent poetical imagination of a Valmiki to induce the employment of an equivalent word which would so aptly seem to convey the idea imparted by their appearance.—*Reverend William Taylor.* See Inscriptions; Jagannath; Kasambi; Krishna; Mahabharata; Nath; Rama; Veda; Vidya; Vishnu.

RAMBABHA—? A very plentiful tree of Akyab which grows to a large size, and is sometimes used for plauks.—*Cal. Cat. Ex.* 1862.

RAM BABUL, HINDU. *Acacia Arabica*, var. *cupressiformis*.

RAMBAYA or Rambiya, MALAY. *Metroxylon sago*; *Sagus lævis*.

RAM BEGUN, BENG. *Solanum ferox*. *L.*

RAMBEH, MALAY. *Pierardia dulcis*, Another species of the same genus is called *P. sapida*, from its also yielding an edible fruit. It is found in the district of Tippera, to the eastward of Calcutta, and also in China, where it is cultivated for its agreeable fruit, it is there called Lutqua, and is called Luteo by the hindoos on the eastern frontier of Bengal.—*Eng. Cyc.* See Duku.

RAMBHA, HIND. PJI. A sort of flat trowel or hand hoe, like the khurpa of Hindustan.

RAMBODDE, near Newera Elia in Ceylon presents superb cascades in the rainy season.

RAMBOWE. A Malay State, N. and E. of Nanning, and Salangore. It has two divisions, Rambowe Ulu and Rambowe Ilir, each under its own four suku or heads of tribes, and all subject to the control of one panghula who resides at Chembong. Besides Malays, are several aboriginal tribes inhabiting the slopes of the mountains and the forests, who subsist by hunting, to whom the resident population apply the general terms Orang Benua. They are subdivided into several tribes, among the most remarkable of which are the Udai, Sakkye, Jakun, and Rayet Utan. The last three do not differ from one another. Their features are of the Malay caste. Their hair is sometimes straight like that of the generality of Asiatics, but, more frequently curling, at the same time very different from the frizzled locks of the African. Their stature is short, but they do not differ much in complexion from the Malay. They bear little resemblance to the descriptions of the Semang in the interior of Quedah, or to the thick-lipped, woolly haired Papuan. Malays entertain a high opinion of the medical skill of these tribes who are to be found over the whole of the interior of this part of the Peninsula particularly in Ulu-kalang, Sungi Ujong, Johole, Jompole, Jellabu, Ulu Muar and Segamet.

The tribes of Rambowe are,

Rambowe Ilir.

<i>Tribes.</i>	<i>Heads of Tribes.</i>
Battu Ampar.	Gompar Maharaja.
Payu Kumba Barrat.	Mera Bongsas.
Munkal.	Sangsura Pahlawan.
Tiga Nenik.	Bongsas de Balang.

RAM DOOLIYA. BENG. *Elæocarpus aristatus*.

RAME. Ir. Copper.

RAMENA PU MARAM. TAM. *Sterculia guttata*.—*Roxb*.

RAMERTUG. Rus. Cambric.

RAMESA. A name of the chief of the Suryansa race, king of Kushala, of which Ayodhya was the capital. His sons were Lava and Ush.

RAMESES II was the Pharaoh who oppressed the Israelites, but Menephtah was Rameses I and was reigning at the Exodus. We know nothing of him, but his tomb is in the valley of king's tombs near Thebes. The name of his son and successor is variously written in the hieroglyphics.

The tomb of king Oimeneptah near Thebes is the most beautiful in Egypt; and as it escaped the search of the Greeks, Romans, and Arabs, it was in good preservation. In a small vaulted room once stood the alabaster sarcophagus of the king which is now in Sir John Soane's museum. With the sarcophagus had been buried many hundred small images made of wood, in the form of mummies, which were there placed by the mourners at the funeral in token of their grief. The walls of these caverns are covered with painted and highly-finished sculptures, and several curious fables. On the sarcophagus there is the conquest of the Eternal Serpent, the great enemy of the human race, whose conquerors bear along his lengthy folds in solemn procession. There also within a garden are seen the river which divides life from death, and the bridge of life, and the keepers of that important bridge; there also are the tombs of the dead, their doors, and the keepers of those doors. The god Osiris is there sitting to judge mankind, who are mounting up the steps of his lofty throne; before him are the great scales to weigh the conduct of the dead, and beneath his feet are the wicked men labouring with hatchets, as if condemned to work in the Egyptian gold mines. That solemn trial of every man for his conduct in this life, which was to fix his reward or punishment in the next, was enacted by the priests as part of the funeral ceremony. They put on masks distinctive of the several gods, and thus received the body in due form. Osiris sat on a raised throne holding his two sceptres, and wearing the crown of Upper Egypt. Before him were placed the offerings and the dog Cerberus, and near him were seated the four lesser gods of the dead. The deceased holds up his hands in prayer and is introduced by two goddesses, each wearing on her head the emblem of truth. A large pair of scales is set up, which is adjusted by the dog-headed Anubis and the hawk-headed Horus. In one scale is placed the heart or conduct of the deceased, and in the

other a figure of the goddess of truth. A small weight is moved along the beam by Horus, to make the two scales balance, and to determine how much the conduct falls short of the standard weight. Thus is measured the goodness and the failings of the life lately ended. Forty-two assessors are at hand to assist Osiris in forming his judgment, which when pronounced is written down by the Ibis-headed Thoth. Those who were too intimidated to listen to a sermon might thus learn wisdom from what they saw with their eyes, and this ceremony was a forcible method of teaching the ignorant multitude, that a day of judgment awaits us all after death, and that we should so regulate our lives that when weighed in the great balance they may not be found wanting. Of king Amunmai Rameses II. son of Oimenephthah, are carved and painted on the walls of the temples of Thebes his victories over Negroes and Ethiopians, over Arabs, and over a people whose single lock of hair on a shorn head proves that they were of a Tartar or Scythian race; he slays them to the honour of the god Amun-Ra.—*Sharpe's History of Egypt, Vol. I. pp. 71, 73 74, 75, and 80.*

RAMESSID. See Ken.

RAMESWARA. See Rameshwara; Kala; Priyanath.

RAM GANGA. See Kamaon.

RAM GHAT. A ghat or pass through the mountains of the western ghats, leading from Belgaum to the sea shore.

RAMGANGA, a river running near Moradabad, Bareilly and Kurruckpur in Oudh.

RAMGHUR, a revenue district of Bengal formed out of the ancient Bahar. See Kol.

RAM-GOOA, BENG. Slender betel-nut tree, *Areca gracilis*, also *Caryota urens*.—*Linn.*

RAM HORMUZ. See Kab.

RAM HEGLA, BENG. *Typha angustifolia*.

RAM HUN. HIND. qu? **RAN-HUN.** The wild dog, *Canis primævus*, is a native of the Cashmere ranges, and although not so common, is by no means rare; it is so stealthy in its habits that attempts to obtain specimens often prove abortive. They hunt in packs, and attack the largest deer. Even the Cashmere stag is said to be brought to bay and killed by packs of wild dogs. The wild dog seen by Dr. Hooker on the Khasia mountains, and known there by the names kulsum, and khas may be a different species, though Colonel Sykes considers it identical with the kulsum of the Deccan, *C. dukhunensis*.—*Adams.*

RAMI also called Tali Rami. **MALAY.** The China-grass of China *Bomheria nivea*, a nettle, the bark of which furnishes a thread remarkable for strength and durability.

RAMICHUM, MALEAL. *Andropogon citratus*.

RAMI TSJINA, i. e. "Chinese Rami," a name given by the Malays to the jute, *Corchorus olitorius* to the true hemp; and to the *Urtica nivea*.—*Royle.*

RAMIUM MAJUS, RUMPH. China grass.

RAMISWARA, Ramisseram, written Rama Iswara, Ramisseram and Rama Ishura, is a small island, situated between Ceylon, and the continent of India, at the entrance of Palk's passage in the Straits of Manaar; where there stands a very ancient pagoda, and formerly an Observatory. It was found by Colonel Lambton's Survey to lie in 79° 23' 5" (5 h. 17' 28" 20") longitude of Greenwich, in 77° 1' 50" (5 h. 8' 7' 30") east of Paris, and consequently in 3° 28' 50" (14' 55" 20") east of Lanka, its latitude being 9° 18' 7" N. Many Telugu and Tamil astronomers, as Baladityacalu, and Mallicarjanadu refer their computations to the meridian of Ramiswara. It is, in a line with the island of Manaar, near Ceylon, which forms the Adam's Bridge, famed throughout India as a hindu shrine. It is united by a bank of sand to the island of Manaar. Hindu pilgrims resort to Ramisseram from remote parts of India; Its celebrated temple is sacred to Vishnu in his avatara of Rama, called Ramiswara; or, in its neighbourhood, Ramisseram, conformably with the Tamil and Canara termination of names, ending with a vowel or a liquid. This temple was visited by Lord Valentia.—*Moor.*

RAMJUNNE, a mahomedan dancing girl.
RAM KANTA. HIND. MAR. a variety of *Acacia arabica*.

RAM-KELA, HIND. *Stauntonia latifolia*.

RAM-KULA B. and H. *Musa sapientium*, *Musa paradisiaca*.

RAM MOHUN ROY, a religious reformer of the hindoos, the only great mind to whom modern Bengal can point. He went to England where he died, and was buried near Bristol. He was the founder of the Brahma Samajh. He was wealthy. He was a native of Calcutta and a great reformer of the hindoo religion; author of *The Precepts of Jesus*, the *Guide to Peace and Happiness*. He visited England twice, and died and was buried there near Bristol. He translated books, passages and texts of the Vedas. His exertions for the abolition of Suttee were great. He distinguished himself in India by his spirited attacks on the prevailing system of idolatry; and by his benevolent efforts, to convince his countrymen of the guilt of Suttee or female immolation. From his inculcations the reforming sect known as the Brahma-Samajh was founded.—*Dr. Marshman's Defence of the Deity and Atonement of Jesus Christ, London, 1822. Calcutta Review.*

RAM NAOMI is a hindoo festival in honour of the birth-day of Rama Chandra, at Oudh, B.C. 1400, and is held from the 1st to the 9th of Chaitra, about 12th April. During the nights of the nine days, Kirtan is preached, the Ramayana is recited, sprinkling with the red gular powder, and natching. Rama is said to have become incarnate at noon of the 9th day, the object being to destroy Ravana, the ten-headed tyrant of Lanka or Ceylon, and which he effected with the aid of Hanuman, the chief of the monkey tribe. On the Ram Naomi, the images of Rama in the temples are decorated with ornaments, and brocade, and at noon, the image is brought out, as if then incarnate, and put into a cradle, on which there is much rejoicing and throwing of gular. Rama is commonly described as an incarnation of Vishnu and the observances of the Ram Naomi is chiefly performed by worshippers of Vishnu. Naga Panchami is celebrated on the 5th of Shravan, which commonly falls about the 4th August. The serpent Kali, said to have been slain by Krishna, is worshipped at this festival, and the women proceed to snakes' holes, circle round hand in hand, prostrate themselves and pray for blessings.

RAMNIA. HIND. *Cratægus oxyacantha*.

RAMNAD, a town on the Paalk's Straits in the Gulf of Manaar.

RAMNAGGAR, in L. 22° 39'; L. 80° 32' in Malwa, on the left bank of the Narbada, one day's march E. of Mandla. The entrance to the fort is 1,588 feet and the level of the Narbada at Ramnagger 1,514 feet above the sea.—*Schl. Roxb.*

RAMNAGGER, in L. 24° 13' and Lon. 81° 10' in Malwa, N. of the Son, on one of its affluents. The mean height of the plain is 1,172 feet above the sea.—*Schl. Roxb.*

RAMPUR in the western Himalaya, in L. 31° 31' N.; L. 77° 37' E. is the chief town of the hill state of Basahir. The valley of the Sutlej near, is 2,912 feet above the sea. Basahir, a petty state near Simla, is independent, governed by a rajah, whose dominion also extends over Kunawar; it commences a very little north of Kotgarh, and occupies the south side of the river Sutlej and the mountain slopes above it, as far east as the confines of Kunawar. The valley of the Sutlej in the western part of Basahir, from Rampur downwards, has an elevation

of little more than 3,000 feet, Rampur 3,140 feet above the bed of the river, being 3,400 feet above the level of the sea. The river at the height of the rains, is an impetuous torrent of great size. Rampur, 12 miles from Nirat, is shut in a gorge of the mountain and elevated in a terrace above the Sutlej, a jhula or suspension bridge 211 feet long connects it to Kulu. It has a population of 3,000, and carries on a trade with Tibet, Ladak and Kulu chiefly in shawl wool. It manufactures white soft shawl cloths, and has fairs or melas in May and November. It is built on a small level tract of ground, about a hundred feet above the bed of the river Sutlej, which it overhangs and which is there 211 feet wide. An alteration of the level of the river occurs at different periods of the day, from the variable amount of solar action on the snows by which it is fed.

The *Guddee* tribe resembling the G'hosi, are now mostly mahomedans, and have a few scattered communities in several pergunnahs, such as in Gurhmooktesur and Surawa of Meerut, and the Rampur territory. It is not unusual to call any converted hindoo a Guddee, which is looked on by a mahomedan as a term of reproach.—*Elliot's Supp. Gloss. Dr. Thomson's Travels in Western Himalaya and Tibet*, pp. 51—54.

RAMPUR is a station of the Rajashay district of Bengal, 125 miles from Calcutta.

RAMPUR, in L. 23° 40' 7"; L. 81° 3' 1", in Malwa, 2 miles E. of the large fort Bandugarh is 2,436 feet above the sea.

RAMPUR BOLEA, in 24° 21' 8"; L. 88° 34' 3", in Bengal on the Podda, one of the branches of the Ganges. The mean height of the station is 56 feet above the sea.—*Schl.*

RAM RAYI. See Hindu; Sikh.

RAMREE or Yambie, or new Island, forms the N. E. side of Cheduba Strait, is of moderate height near the sea, and extends N. W. to Saddle Island in lat. 19° 26' N., on the north side of which is the entrance to Khyouk Phyou harbour. From its southern point, the islands of Amherst or Juggoo, Adam Hill, Wyndham and Harrison project in a chain. Many wells of petroleum or earth-oil are met with. They are generally situated near the bases of low hills, and are of various depths. The deepest is said to be about fifty feet, having about six feet diameter at the

mouth. The sides of this well have been ingeniously boarded by the natives, having diagonal cross bars, which not only secure the structure but serve as a ladder. There is no sort of machinery used to get up the oil. A young lad is first sent down, a man on the cross bars lets down to him earthen pots in succession, into which the contents of the well are filled, and then the pot is drawn up. The whole of the contents of the pot, as drawn up, is not oil, which is of a light bluish colour and floats on water, there is sediment scooped up from the bottom. This takes place twice a day, and the yield is from four to six gallons per day. The oil sells in the bazaar at a rupee per gallon. The deepest of the wells in the island of Ramree is situated in the Laytoun Circle, and is said to have been productive for a great number of years. Natives have been known to dig wells of short depths for temporary purposes, after which the wells are abandoned and soon choke up from the falling in of the earth. There is a fish found in these waters called "Luckwa," the oil extracted from the liver of which is said to have the same properties as cod liver oil. The island lying about two and a half miles to the westward of old Kyook-Phyoo, is called on old marine charts "Saddle Island" from its shape. When Kyook-Phyoo was a military station, some of the officers it is said let loose thereon a pair of goats; these have increased to such an extent; that the island now abounds with wild goats and hence it is now called by the natives "Chy-Kyser," or "Goat Island."

RAM TCHOO. LAKE. is frequented by great abundance of water-fowl, wild-geese, ducks, teal, and storks, which, on the approach of winter, take their flight to milder regions. Prodigious numbers of the saras, the largest species of the crane kind, are seen here at certain seasons of the year, and any quantity of eggs may there be collected, they are found deposited near the banks, they were as large as a turkey's egg.—*Turner's Embassy.*

RAMTEK, 24 miles N. of Nagpur, has ever been amongst the hindus a chosen seat of religious veneration. Of the many old temples, the oldest appears to be one in a small dell on the north side of the hill. It is built of hewn stones, well fitted together without mortar. From its shape and structure it is probably a Jain temple, though local tradition would make it the work of one Hemarpant, by some, said to have been a brahman by; others a "Rakhasa," with whose name many remains of buildings in the Bhandara and Nagpur districts are connected.

RAMUSI or *Ramoosi*, are a tribe dwelling near the Bombay ghats. They have immigrated from Telingana within a recent period, and though they have adopted Marathi, they preserve a few words of their original Telugu for purposes of crime. They are a Telugu race who crossed into the west of India, and there assumed predatory habits. They speak the Telugu tongue in their families. They are in small numbers west to Bombay, southwards to Sholapore, and northwards towards Berar. In the Mahratta country, the low caste tribes, are the humbler village servants, the Ramusi, Bbil, Gond, Mhar and Mhang, all of whom serve as watchmen. The Ramusi, Kallar, Marawar, Beder are sturdy semi-military predatory races. Below the ghats near Bombay the dher are known as Parwari. As amongst the Dravidian races in the south of India, so the various Arian or Hindi districts contain numerous small tribes, the supposed remnants of a prior colonization, and mostly supposed to be, like the Tamil, people of Tartar or Scythic descent. Of these, are the Ramusi of the Bombay Presidency.

RAMUTH. HEB. Coral.

RAMZAN, a mahomedan month of fasting and prayer. The Eed or festival at the close of the Ramzan, is held on the 1st of Shawal,

is Feraiz, as also is the Eed of the 6th day of the 18th month or Zihaj or Bakr-Eed.

RAN, also Ranwar. MAHR. Wild : a forest.

 „ esculent a S. China.
 „ sylvatica *Leconte.* Ningpo.
 „ gracilis, *Wieg.* from Madras to S. China.

—*Gunther.* See Reptiles ; Frogs.

RANA, a title of the rulers of Mewar, a rajput race whose capital is Oudeypur, but is also given to the chief of Porebundar. Rama had two sons, Loh and Cush: from the former the family of the rana of Mewar claim descent. He is stated to have built Lahore, the ancient Loh-kote ; and the branch from which the princes of Mewar are descended, resided there until Keneksen emigrated to Dwarka. The difficulty of tracing these races through a long period of years is greatly increased by the custom of changing the appellation of the tribe, from conquest, locality, or personal celebrity. Sen, an army, seems to have been the martial termination for many generations : this was followed by Dit, or Aditya, a term for the sun. The first change in the name of the tribe was on their expulsion from Saurashtra, when for the generic term of Suryavansi, was substituted the particular appellation of Gehlote. This name was maintained till another event dispersed the family, and when they settled in Ahar, Aharya became the appellative of the branch. This continued till loss of territory and new acquisitions one more transferred the dynasty to Seesoda, a temporary capital in the western mountains. The title of Ranawut, borne by all descendants of the blood royal since the eventful change which removed the seat of government from Cheetore to Oodipoor, might in time have superseded that of Seesodia, if continued warfare had not checked the increase of population ; but the Gehlote branch of the Suryavansa still retain the name of Sisodia.—

The solar dynasties are three, viz :—

1. Grabilot or Gehlot or Geholot, with 24 sakka or branches of which the Sisodia is the most distinguished ; and the rana of Udayapur is a Grabilote.
2. Rahtor, said to be descended from Rama by Kusa his second son. It has

24 branches ; and the raja of Jodhpur or Marwar belongs to this tribe.

3. Kachwaha also sprung from Kusa. The rajah of Jeypur is of this tribe. It has 12 kotri or houses.

The Lunar dynasty is sprung from the moon, through Yadu or Jadu, and is called Yadu or Jadu. It has 8 branches, of which the Jhareja and Bhatti in Cutch and Jeyaulmer are the most powerful.

The Agnicula have four tribes and 87 branches, viz. :—

1. Primara with 35 branches.
2. Parihara „ 12 „
3. Chalukya „ 16 „
4. Chouhon „ 24 „

In the 36 royal tribes, there are others, the origin of which is not known, such as

RANA BILLA, or Purudona, *Mallee* Rothii, *Ad. Juss.*

RANADITYA, according to all accounts, was a very powerful prince, but native writers have accredited him with the miraculous reign of 300 years. This has naturally given rise to much speculation as to the period of his reign, but general Cunningham places it as between A. D. 480 and 555. The date therefore of the two smaller temples of Ranesa and Amriteswara may be assumed as about A. D. 500.—*Colo, Ill. Ancient Buildings of Kashmir.*

The flowers solitary, sessile, is a native of Ceylon and British India in moist places.

The flowers are large, white and fragrant, and in twos or threes at the top of the branchlets. The berry is about the size of a pullet's egg, ash-coloured or olive-grey, and 2-celled. The seeds are flattish, nestling in the pulp. The unripe fruit is employed as a vegetable dye.—*Thw. Enum. Pl. Zeyl. ii. p. 159.*

RANDU-KUNING. MALAY. a yellowish and close grained wood.

RANEE. HIND. A princess, a queen.

RANEE CHANDA, one of the inferior wives of Ranjet Singh, chief of the Sikh kingdom, and mother of the maharaja Dhuleep Singh. She was the sister of Juwahir Singh. She proclaimed Dhuleep Singh sovereign in 1843, and assumed regency. From this she was removed by Lord Hardinge, but she continued to intrigue, and she was removed to Benares from which however she fled to Nepal.

RANEEGUNGE so called from the ranee of Burdwan, who had the proprietary rights vested in her name.—*Tr. of Hind. vol. I., p. 170.*

RANEEZYE, towards the lower extremity of the Swat valley, a formidable range of hills, bounding the valley runs for many miles from east to west, nearly parallel to the British frontiers; and at the eastern extremity of this range stands the Mora mountain. Between this range and the frontier, however, intervene two tracts, named Ranezye and lower Osman-kheyl, both quasi dependencies of Swat. The best of the passes leading into Swat is named Mulla-kund, which opens from Ranezye. A little further to the eastward of Ranezye also there are some passes, leading into the Loondkhor valley, which belongs to British Eusufzye. These latter passes are not available for passage from Swat to British territory, because leading into Loondkhor, they can be stopped by any party holding that valley. The passes via Ranezye and Osman-kheyl, if the people of those tracts accord a passage, lead straight on to the British Plains of Hushtnuggur. Above the Loondkhor valley, just beyond the British frontier, is the strong village of Pullee. The sub-divisions of the Peshawur district adjoining the tribes above described, are Loondkhor or north-west corner of Eusufzye, and then Hushtnuggur. See Khyber.

RANGIT in L. 27° 19'; L. 88° 16', a river in Sikkim, a little above the junction with the Kalhet, the level of the river is 1,839 feet, 2 miles S. of Tassidong, the level of the river is, 2,030 feet.—*Hooker*.

RANGOLI. HIND. *Physalis sp*.

RANGO PEAK. in L. 33° 8'; L. 78° 54' in Ladak, N. of Hanle. The top of the peak is 20,786 feet.—*Cunningham*.

RANGOON, the chief town of British Burmah, was founded in the second-half of the sixth century before Christ by a missionary body of buddhists. It was rebuilt in 1755, by Alompra, and named by him the "Peace effected" or according to some "Victory achieved" in commemoration of his conquests. In a commercial point of view, it is the most important town of Pegu and of British Burmah. It is built on the left bank of the Irawadi, twenty-six miles from the sea, and possessing a continuous water communication with the upper provinces, its situation is most convenient for foreign trade. Rafts of valuable teak timber are floated down from the vast forests of Pegu and the mountainous districts of Ava. It thus presents great facilities for ship building which indeed has been carried on here since the year 1786. The Elephant Pagoda, by Captain Heywood's observations, is in lat. 16° 29' N. long. 96° 25' E., and the Shooay Dagon pagoda, according to Lieut. C. Y. Ward, I. N., is in lat. 16° 47' N., and long. 96° 10' E. At full and change, it is high water at the Elephant point and occurs on Rangoon bar about 8½ hours (Qu. 5½). The Rangoon river is called also Sirian and Pegu river. Velocity of tide 4 and 5 knots. Rise of tide then and for two

days afterwards from 20 to 25 feet, and 13 and 14 feet on the neaps. During the springs in the S. W. Monsoon, it at times blows very strong, when great care should be taken not to get to the eastward of the middle ground between which and the Zingaat mountain or Martaban shore, the sands extend a long way to seaward over which the bore rushes with the flood, which makes it very dangerous when near them: the same bore runs up the Sittang River 15 leagues east of Rangoon bar. It is very slightly felt in the Delta or of the Irawadi. Horsburgh mentions the bore as being in the Rangoon river, but it merely rushes over the extensive sand at the entrance of the Rangoon river and on the Sittang. There is a bore in Bassein Creek, which joins the Rangoon and China Buckue branch, but it is not known into which entrance it runs. Rangoon has been twice taken by the British Indian armies, once on the 11th May 1824 and, again, on the 5th April 1852, and the British soldiers are now cantoned on the S. W. and West of the Shooay Dagon pagoda.—*Winter's Six Months in Burmah*, p. 6. See Burmah; Irawadi.

RANGPUR, a district and town in Bengal, the town 268 miles from Calcutta.

RANGREK. HIND. *Pyrus aucuparia*, also *Spiraea Lindleyana*.

RANGRI BASHA, a hindi dialect spoken in the central parts of Hindustan and on the western borders of Rajputana. In the schools of Central India the common language taught is the dialect of the Hindi termed Rangri, which as well as accounts, is learnt by all the children who can afford it. The Rangri Bhaka prevails as far west as the Indus, east as far as the frontier of Bundelcund, south to the Satpurah hills, and north to Jeypoor, Joudpoor and Jeyulmer. There is, in different provinces, a difference in the pronunciation, in many of the words, but the language is the same, and is written in the same character. Many books and songs have been composed in this language. The word Rangur the Rajputs say, is derived from "Run," signifying battle, and Ghur, a fort, an epithet asserted to have been given them by one of the kings of Delhi, expressive of their bravery, but the Mahrattas say, that the derivation is from Ran, which means a jungle or forest, and Gurree, a man, or metaphorically a barbarian.—*Malcolm's Central India*, Vol. II, p. 191.

RANG-SAL or **SANG-SAL,** the name of the great idol at Bamian.

RANGUNGA, a tributary to the Ganges, rises in Kumaon, in lat., 30° 6', and lon., 79° 20'; about 7,144 feet above the sea. It runs S. E., 20 m.; S. W., 70 m.; S. to Moradabad S. E. and S., into the Ganges. Length, 325 m. It receives the Kosee, 150; Gurra, 240 m. It

is fordable at Moradabad, at 15 miles below its confluence with Koasee; but not usually fordable below Jellalabad.

RANI. The consort of a hindu raja, a queen. The queen of England is known in India by the hindu title rani, and by the mahomedan title malikah.

RANIAH was founded by Rai Sing of Bikander, and named after his queen or Rani to whom it was assigned. It was taken by Imam Mahmood.

RANI of Jhansi was the widow of a Bundela chief, called Gungadhar Rao, who died in 1854, having adopted a son. But lord Dalhousie declared the Jhansi State a lapse and when the revolt and rebellion occurred, she instigated the native regiments there to rise, and the British officers sought refuge in the fort. Unable to hold out, they capitulated on terms, but with one exception, the sepoys destroyed man, woman and child. The Rani then re-assumed sovereign power, dug up cannon, and assembled an army of 14,000 men, but sir Hugh Rose opened fire against the place on the 25th April 1858. The place was stoutly defended, even women aiding, but the town and fort fell on the second and third days, the Rani fled to Calpee, Gwalior and Sipri in succession, and fell in action at Morar on the 17th June 1858. She was energetic and able.

RANIGANJ, coal is worked here.

RANIGHA, a musician amongst the Mah-rattas.

RANI-GOVINDI—? **HIND.** Didymocarpus aromaticus.

RAN PANGARA. **MAR.** *Erythrina indica* and *Erythrina suberosa*.

RAN SARRAS. **MAR.** *Acacia odoratissima*.

RANUNCULACEÆ *DeC. Lindl. Nat. Syst.* About 80 species have been discovered in N. America; 32 in S. America; 30 in China; 21 in Australia; 15 in N. Africa; 20 in S. Africa; 6 in Mexico; 5 in the W. Indies; and a few in Japan, Cochinchina, and Sierra Leone. Dr. Wight asserted that wherever, within the tropics, we meet with herbaceous forms of Ranunculaceæ, we may feel assured of jungle fever. In 1818, according to DeCandolle, the India known forms of this order amounted only to 19. At present their number has risen to 135; viz., 32 species of *Olematis*; 3 of *Naravelia*; 18 of *Thalictrum*; 16 of *Anemone*; 1 of *Adonis*; 32 of *Ranunculus*; 3 of *Caltha*; 1 of *Trollius*; 1 of *Copis*; 2 of *Isopyrum*; 2 of *Aquilegia*; 14 of *Delphinium*; 7 of *Aconitum*; 1 of *Actæ*; 1 of *Cimicifuga* and 1 of *Pæonia*. Eight of these also belong to Europe. Acridity, causticity, and poison, are the general characters of this order, which, however, contains species in which these qualities are so little developed as to be innoxious.—*Voigt, p. 1. Wight, (Ill. p. 3)*

RAN SARRAS. **MAR.** *Acacia odoratissima*.

RANSCHGELB. **GER.** Yellow sulphuret of Arsenic.

RAN TAMBUT, also Uttuk. **MAR.** *Flacourtia montana*.

RANUNCULUS, a genus of plants belonging to the Ranunculaceæ or Crow foot family. *R. aquatilis* L. grows at Saharunpur, *R. arvensis* L. grows in S. Europe and on the mountains of Kumaon. *R. bulbosus* is a plant of Kunawar and of Europe and America, *R. indicus*, *Roxb.* of Europe, Siberia, Cochinchina, India, Serampore, Calcutta, &c. has small, yellow flowers. It is a very acrid plant; when applied fresh, quickly producing a blister.

RANUNCULUS INDICUS. *Roxb. Syn. of Ranunculus scelerotus.—Linn.*

RANUNCULUS SCHLERATUS.—*Linn. Syn. of R. Indicus, Roxb.*

RANZURA. **HIND.** *Pinus longifolia*.

RAO. A hindu title originally meaning a chief or prince; now in general use as a title of honor.

RAO, a river near Najibabad, in Bijnour,

RAO. HIND. of Pangi, *Abies Smithiana*, Himalayan spruce.

RAO NANO RAO. See Kabul.

RAONG and **Raongi**, pulses of Kangra.

RAOTA. HIND. See Phiraota.

RAOTI. HIND. A kind of tent.

RAPE, the plant *Brassica napus* is the common or cultivated rape seed or cole seed plant, from the seeds of which is expressed the rape seed oil the *Sarson-ka-tel*. HIND. so extensively used for lubricating machinery, and the refuse is the rape cake used for feeding cattle for which also the green stalks are used.

Rape seed. Seed of *Brassica napus*.

Roefero..... DAN. | **Sursi**, **Surras**, **Guz**. HIND.
Graine denavette... FR. **Sherabapa**.... SANS.
Rapaat GER.

The produce of a hardy biennial plant, of the cabbage tribe extensively cultivated in England and on the Continent, on account of its seeds, which are crushed for oil, and its leaves, are used as food for sheep. In India, also it is extensively cultivated, whence both the seeds and oil are largely exported to England and France.—*Hogg, Vegetable Kingdom*, p. 67.

RAPESHO. HIND. *Lonicera hypoleuca*.

RAPHANUS, a genus of plants of the order *Brassicaceæ*.

RAPHANUS CAUDATUS.—*Linn.*

Long podded Radish. | **Mugra**..... HIND.

This curious plant, with its enormously elongated seed-pods, has excited much attention in Europe, where the seeds sell at a high price. It is cultivated in Guzerat and the Punjab, and in the latter place the seed can be easily had for Rupees 2 a seer. The natives have an idea that this is only the *R. sativus*, subjected to a peculiar treatment, viz. being taken up, and having all its roots cut close round and then re-planted.—*Dr. J. L. Stewart*.

RAPHO-CHE, OR **RA-CHE**, and the female *Ra-mo-chhe* Tibetan, means the great goat, and is the *Mar-khor* or snake-eater of the mahomedans. It is common in Balti, Badakshan and Chitral.

RAPHUS. Brison's name for the Dodo.

RAPO, **BUGIS**, *Areca catechu*.

RAPSAAT, GER. Rape seed.

RAPTEE, a river near *Bheempedee* in Nepal and near *Gorukpoor*.

RAPTORES or *Birds of Prey* are numerous in India, the peregrine falcon, the true hobby, the kestrel, the British sparrow hawk, all the Indian harriers and the Short-Eared owl are true migratory birds. See *Birds*.

RAQM. PERS. The Persian term for the phonetic expression of the numerical powers of the Arabic letters. The following is an

attempt to reduce the orthography of the Roman equivalents to as close an adherence to the literal definition of the original Kufic as the nature of our English system of writing will allow. In this case, the nine letters of the Arabic alphabet whose powers have been perverted in the utterance of foreigners have been made to follow the Persian system of phonetic expression, and are severally represented by the following English pointed or accented equivalents:—

Tiss.	C.	k.	guttural	a	"u," etc.	z.	th (father)	t.	d	s	th (his)	h	h	s	th (thick)	The Arabic powers of these letters are severally.....	The Persian phonetic expression.....
9	ع	ك	ك	ا	ا, "u," etc.	ز	ث (father)	ت	د	س	ث (his)	ه	ح	س	ث (thick)		
8	ع	ك	ك	ا	ا, "u," etc.	ز	ث (father)	ت	د	س	ث (his)	ه	ح	س	ث (thick)		
7	ع	ك	ك	ا	ا, "u," etc.	ز	ث (father)	ت	د	س	ث (his)	ه	ح	س	ث (thick)		
6	ع	ك	ك	ا	ا, "u," etc.	ز	ث (father)	ت	د	س	ث (his)	ه	ح	س	ث (thick)		
5	ع	ك	ك	ا	ا, "u," etc.	ز	ث (father)	ت	د	س	ث (his)	ه	ح	س	ث (thick)		
4	ع	ك	ك	ا	ا, "u," etc.	ز	ث (father)	ت	د	س	ث (his)	ه	ح	س	ث (thick)		
3	ع	ك	ك	ا	ا, "u," etc.	ز	ث (father)	ت	د	س	ث (his)	ه	ح	س	ث (thick)		
2	ع	ك	ك	ا	ا, "u," etc.	ز	ث (father)	ت	د	س	ث (his)	ه	ح	س	ث (thick)		
1	ع	ك	ك	ا	ا, "u," etc.	ز	ث (father)	ت	د	س	ث (his)	ه	ح	س	ث (thick)		

RARA. HIND. *Randia dumetorum*. In Kangra it is *Pongamia glabra*.

RARAR. HIND. *Aralia Cachemirica*.

RARI. HIND. of *Chenab*. *Rhamnus purpurea*, also *Prinsepia utilis*.

BARK, MALEAL. *Sapindus emarginatus*.—*Vahl*. Soap-nut.

RAS. MALAY. Castor.

RAS. AR. A cape, a headland.

RAS. HIND. *Rasa*. **SANSO.** a circular dance performed at the festival of Krishna by cow-herds and worshippers of Krishna.

RASA, also *Sutum*, also *Parada*. **SANS.** Mercury.

RASA GADI MANU. **TEL.** *Solanum pubescens*, *R. I.* 564.

RASALAH. A troop of horse: a pamphlet. *Rasaldar*, a commander of a troop.

RASAM. TAM. TEL. Mercury.

RASA-MALA. MALAY. Liquidamber altingia.

RASA-MANDALA. This mystic dance, appears analogous to the Pyrrhic dance, or the fire dance of the Egyptians. The movements of those who personate the deity, and his fair companions are full of grace, and the dialogue is replete with harmony. The Chobi of Mat'hura and Vindravana have considerable reputation as vocalists; and the effect of the modulated and deep tones of the adult blending with the clear treble of the juvenile performers, while the time is marked by the cymbal or the soothing monotony of the tabor, accompanied occasionally by the murali or flute, is very pleasing.—*Tod's Rajasthan*, Vol. I. p. 543. See *Hooly* or *Hohli*.

RASAN. HIND. Transmutation of metals.

RASANNA. HIND. *Berthelotia lanceolata*.

RASAUT. HIND. The extract from the wood and roots of the *Berberis aristata* and other species of berberry.

RASE KUSTURI. MALAY. Civet.

RAS-EL-AIN. See Mesopotamia.

RASGRAMEE. See Kunawer.

RASH, in Bombay, a salt measure of capacity for weighing about 40 tons, nearly 14½ lasts.—*Simmond's Dict.*

RASHA. HIND. *Tribulus alatus*.

RASHANA or **ROXANA**, mother of the child of Alexander the Great. See *Kabul*.

RASHID-UD-DIN, author of *Jami-ut-Tuarih*, was written (A. H. 710) A. D. 1310, gives a picture of the knowledge regarding in India which mahomedans possessed at the close of the tenth century.—*Elliot's Hist. of India*.

RASHOON. BENG. *Allium sativum*.—*Linn.*

RASI. BALI. *Chavica seriboo*.—*Miq.*

RASIKULIA RIVER. See *India*.

RAS JAR D'AFOON. See *Abdul Koory*.

RAS MUSSUNDUM. See *Muskat*.

RAS KAPUR. HIND. Calomel. See *Mercury; Medicine*.

RASKIACH. HIND. *Astragalus sp.*

RASNA, BENG. *Rheum palmatum*.

RASOLNIKI. A fanatic sect in *Kazan*, a horrible practice reigns among some of the members of this sect—that of condemning their persons to mutilation, the females also use vio-

lent means to obtain the same end. The greatest part of the money changers in *St. Petersburg* are said to follow this custom. The severest persecution has been from time to time employed against the *Raskolniki*.—*Turnerelli's, Kazan*, Vol. I, p. 171.

RASO. IT. Satin.

RASORES Gallinaceous birds or game birds, the Gallinæ of *Linnaeus*; the Gallinæ of *Viellot*; and the *Pulveratrices* of some authors. The families and genera of the *Rasores* or game birds, are as under:

FAM. *Megapodiidæ*, 1 gen. 1 sp. 1 *Megapodius Nicobarensis*.

FAM. *Phasianidæ*.

Sub-fam. *Pavoninæ*, 2 gen. 3 sp. viz. *Pavo cristatus*, *Pavo muticus*; 1 *Meleagris gallopavo*.

Sub-fam. *Polypretoninæ* 5 gen. 10 sp. viz. *Pavo*; 3 *Cerionis*, 1 *Ithaginis*, 3 *Gallinæ*, 2 *Polyplectron*, 1 *Argus*.

Sub-fam. *Phasianinæ*, 3 gen. 2 sub-gen; 16 sp. viz. 3 *Gallus*; 7 *Euplocomus*; 1 *Pucrasia*; 3 *Phasianus*; 1 *Thaumalea*; 1 *Lophophorus*.

Sub-fam. *Tetraoninæ*, 2 gen. 2 sp. viz. 1 *Tetragalus himalayensis*; 1 *Lerva nivicola*.

Sub-fam. *Pteroclinæ*, 1 gen. 4 sp. viz. 4 *Pteroclis arenarius*, *Pt. fasciatus*, *Pt. alchata*, *Pt. exustus*.

Sub-fam. *Perdicingæ*, 8 gen. 22 sp. viz. 1 *Numida*, 4 *Francolinus*; 1 *Caccabis*; 2 *Perdix*, *Rhizothera*; 4 *Arboricola*; 3 *Rollulus*; 2 *Perdula*; 4 *Coturnix*.

FAM. *Tinamidæ*.

Sub fam. *Turnicinæ*, 1 gen. 3 sp. viz. 3 *Turnix ocellatus*; *Turnix*; *Dussumieri*; *Turnix*; *Sykesi*.

RASPBERRY. See *Rubus*.

RASSA. MAL. Mercury.

RASSE KURUNDU. SINGH. Cinnamon.

RASSI. HIND. Cordage.

RASTA. HIND. of *Lahul*, *Ribes nubicola*, *glacialis* and *grossularia*.

RASUK. HIND. *Taraxacum officinale*.

RAS-UL-KHYMA, in Lat. 25° 48' N., long. 56° 4' E. A narrow sandy spit, known to historians as the scene of an expedition of the British Government of India against the Wahabee sect. It is an Arabic name, signifying the "Cape or head of the tent," situate on the Arabian coast of the Persian Gulf nearly in latitude 25° 49' North. The Juasme pirates, a tribe of the Wahabi, having captured some of the East India Company's ships, and murdered the greater number of their crews, in 1820 an expedition was sent against them, which completely effected the object of the expedition, by destroying *Ras al Kheimah*, the Juasme capital, and above fifty large dows.—*Ouseley's Travels*, Vol. I., p. 326.

RASU-MUNCHU, the hindoos have a sacred edifice, so called, in which the image of Krishna is annually placed and worshipped. —*Ward's View of the Hindoos, Vol. II, p. 3.*

RAS YATRA, the annual commemoration of the dance of Krishna with the sixteen Gopi. Vast crowds, clad in their best attire, collect in some open place in the vicinity of the town, and celebrate the event with music, singing and dramatic representations of Krishna's sports. All the public singers and dancers lend their services on this occasion, and trust for a remuneration to the gratuities of the spectators. At Benares and Bindraban, this festival is held with much display.

RAT, amongst naturalists, the genus *Mus*. The coffee-rat is an insular variety of the *Mus hirsutus* of W. Elliot, found in Southern India. They inhabit the forests making their nests among the roots of the trees, and feeding, in the season, on the ripe seeds of the nilloo.

The *Mus rufescens*, *Gray*, syn. of *Mus flavescens*, *Elliot*, and *Mus nemoralis* *Blyth*, are named tree rats. They make their nests on the branches of trees in the forest. The tree rat forms its nest on the branches, and by turns makes its visits to the fields and dwellings of the natives, frequenting the ceilings in preference to the lower parts of houses. Here it is incessantly followed by the rat snake, *Coryphodon Blumenbachii*, *Merr*, whose domestication is encouraged by the servants, in consideration of its services in destroying vermin. One day a snake had just seized on a rat of this description and both were covered by a glass. The serpent appeared stunned by its own capture, and allowed the rat to escape from its jaws which cowered at one side of the glass in the most pitiable state of trembling terror. On setting them at liberty, the rat bounded towards the nearest fence; but quick as lightning it was followed by its pursuer, which seized it before it could gain the hedge, through which the snake glided with its victim in its jaws. In parts of the Central Province of Ceylon at Ooreah and Bintenne, the house rat is eaten as a common article of food. The Singhalese believe that it and the mouse are liable to hydrophobia. The genus *Mus*, the rats, has been largely described by Mr. Blyth. —*Tenison's Sketches of the Natural History of Ceylon, p. 423.* See *Mus*; *Mammalia*.

RATA. GHORKA. *Xanthochymus pictorius*.

RATA ATTIKA. SINGH. Figs.

RATALU. HIND. *Dioscorea sativa*.

RATA-ENDURU. SINGH. *Fœniculum panmori*. —*D. C.*

RATA KÆKARI. SINGH. *Cucumis sativus*. —*Linn.*

RATA KOMADU. SINGH. *Cucumis melo*. —*Linn. W. and A.*

RATA-MIRIS. SINGH. *Capsicum Nepalensis*.

RATAN.

Bet, Bed.....	HIND.	Kowe Sunda.....	JAV.
Beta.....	BENG.	Calamus rotang..	LAT.
Cane, Ratan,		Rotan.	MALAY.
Ratan Cane...	ENG.	Pirambu... ..	TAM.
Panjalin.....	JAV.	Bettam.....	TEL.

The Ratan canes of Commerce are obtained from *Calamus rotang*, *Linn.* *Cal. rudentum*, *Lour*: *Cal. Royleanus*, *Griff*, and *Cal. fasciculatus*, *Roxb.* The Malay, rotan, is an abbreviation of raotan from the verb raot, to pare or trim, that is, the object pared or trimmed, but, of this universal product of the forests of the islands, the name is different in all the different languages. Thus, in Javanese, it is panjalin, and in Sunda kowe. The plants which yield ratans are considered by botanists as a genus of the family of palms, which consists of many species from the girth of a goose-quill to that of a stout walking stick. They are abundant in all the forests of the Malay and Philippine Archipelagos, and are every where extensively used as cordage or ligatures, or in the manufacture of mats and basket-work. These singular plants creep along the ground or climb trees, according to the species, to the length of from 100 to 1,200 feet. The principal places of production for the general market are Sumatra, Borneo, and the Peninsula. By far the most valuable, probably a distinct species, is brought from Banjarmassin on the southern coast of Borneo, for in the market they are worth about 150 per cent. more than any others. A vast quantity of ratans are exported from the Malay Archipelago to Europe, Hindustan, and China, though apparently insignificant, they form a considerable article of trade; so many as four or five millions of them being in some years shipped from the territories under the Government of British India, they are products of several genera of palms, which all contribute their quota to the general quantity required in the markets of the East and in Europe. Amongst the plants producing them may be named the genus, *Calamosagus*, of Griffith, with its four species; *C. hariniaefolius*; (*Wallichiaefolius*) termed "*Rotang Simote*;" *C. ochriger*, "*Rotang Donam*," with *C. scapiger*, and *C. lacineosus*. The *Calamosagi*, are all climbing plants. The Ratan cane is used extensively in Burmah and the Tenasserim Provinces, instead of Cordage. The stays of the masts in the native boats, are usually made of ratans, and they are split up

into strings for innumerable purposes, to which cord and twine are usually applied. There are numerous species indigenous in the forests, and the Karen have different names for seventeen species or varieties. Ratans are manufactured by the Chinese into chairs, baskets and other articles, the best are the produce of Malacca and the eastern isles. A coarse description is found in many parts of the Peninsula of India, and are there used for ordinary purposes, as baskets, &c., they also furnish material for the cables of Shakespearian bridges. One species called country rattan, pedda pirambo, *Tam. moti bet, Hind. Pedda bettam, Tel.* grows to a great length in most districts of the Peninsula. When green, it is formed into cables for drawing the cars of the hindoo idols, and in some parts for suspension bridges. It answers better than bamboo for baskets and for strong fences, when interwoven between stakes. The rattan when burnt, yields an ordinary black for paint. About sixty thousand bundles are annually imported into Liverpool, 100 in each bundle, and selling price from 1s. 6d. to 3s. per 100, Total £7,500. The rattans of Borneo are esteemed finer than those produced in any other part of the world, and are exported to Singapore and Batavia in immense quantities from the Coti and Banjar rivers; on the south and eastern parts of the island they are collected, and brought down these streams on rafts by the Dyaks for a very small remuneration; they are principally exported finally from Batavia and Singapore to India and China. The exports of ratans from India are principally from Calcutta and Bombay to the Mauritius, Cape of Good Hope and N. S. Wales, to the value of £3000 to £4000, annually,

1857-8.....	£3753	1859-60.....	£2828
1858-9.....	£4539	1860-61.....	£2500

—*Seeman on Palms. Rohde. M.S. S.—Crawford's Dict. p. 365. William's Middle Kingdom, Vol. II. p. 402. Low's Sarawak, p. 42. Mason's Tenasserim. See Calamus; Canes.*

RATAN FOOT BALL is used in this game by the Burmese.

RATA NELLI. SINGH. *Cicca disticha.—Linn.*

RATAN FRUIT. See *Calamus viminalis.*

RATANJOT, *Onosma echioides.*

RATANKAT. HIND. of Kaghan, *Andromeda ovalifolia.*

RATAN KHAUR. HIND. ? A tree of Ohota Nagpore, furnishing a hard, white timber.—*Cal. Cat. Ex. 1862.*

RATANPUR. A town of the Central Provinces of India, in the district of Bilaspur, situated twelve miles north of Bilaspur town. It was here that the ancient rajas of the

country first held their court, and it was from this point that the early hindu settlers, gradually acquiring strength displaced the aborigines, reclaimed the wilderness and spread over the plain their civilization and faith. The township covers an area of fifteen square miles, and contains within its limits a perfect forest of mango trees, amid the luxuriant shade of which are scattered an almost countless number of tanks and temples. The most prominent of these is near the old fort, where a large building gracefully adorned on all side with arches and minarets, proclaims that here, some 230 years ago, twenty rani of raja Lachhman Sahi became voluntary martyrs to brahmical cruelty and popular feeling.—*Cent. Prov. Gazetteer.*

RATANS, GROUND. The excellent walking sticks known to the English under this name, are made from the *Rhapis flabelliformis* which grows in Lin-kin and Southern China. Most of the fibre used by the Chinese is made from the bark of the coir palm, *Rhapis flabelliformis* called *tsung*, which is stripped off in large sheets from the trunk of the tree; when steeped in water the fibres separate in short wiry threads, of a dark brown color, having all the properties of the cocoanut coir. It is the material from which the cordage in Chinese vessels, and sometimes the cables, is manufactured; brooms, rain cloaks, sandals, hats, brushes for block printing, twine, and other articles are also made from it. The *Rhapis* grows all over southern China, attaining at times the height of 30 feet and upwards; the bark is stripped off every year. The price for the prepared coir is about four sp. dlsr. per pecul. Another kind of coir is also in extensive use in the Archipelago for rigging; it is called *gomuti* or *ejoo*, and the thread sells at sp. dlsr. 1-50 or sp. dlsr. 2 per pecul. The best comes from Amboyna. The excellent walking-sticks known to the English under the name, of *Ground Ratans*, are made from the *Rhapis flabelliformis*, which grows in Linkin in southern China.—*Seeman. Morrison.*

RATAN SAGO PALM. *Calamosagus laciniatus.* See Ratan.

RATEANUJ. HIND. ? Colophony. Resin.

RATEANUJ-ROOMI also Butum. ARAB. Turpentine.

RATH. HIND. A car, an idol car, a four wheeled carriage.

RATHA or Padha Jatra, the procession of Jugganath in his car, a festival in much repute among the hindus of Bengal and Orissa.

RATHMANDI. HIND. *Microlonchus divaricata.*

RATHOR. See Rahtor; Rajput;

RATI-PANCHI. TAM. TEL. Lichen rotundatus.

RATI-SURKH. HIND. *Trichodesma indica*.

RATI, the wife of Kama-deva, the Indian cupid. Rati is the hindoo goddess of enjoyment.

RATI. TEL. Seed of *Abrus precatorius* Rati weights. A jeweller's weight. The root is employed as a substitute for liquorice. The leaves have a similar taste, and mixed with honey are applied externally in swellings of the body and pulverised and chewed with sugar, are given to mitigate coughs.—*Powell's Hand-Book*, Vol. I, p. 341.

RATI BENDA NAVILI. TEL. *Lygodium scandens*.—*Swartz*.

RATINARIA, a Lichen.—*M. E. J. R.*

RATI PACHI. TEL. Lichen, generic term.

RAT JAMBUL. MAR. *Eugenia caryophyllata*.

RATL. AR. One pound, Troy, equal to 5,760 grains.

RAT MUNDI. HIND. *Macrotomia euchroma*, also *Trichodesma indica*.

RATNA. A gem. In hindu mythology, Chatur-desa-ratna are the fourteen articles, called gems, produced by the churning of the ocean. This event is fabled to have occurred in the second incarnation or avatar of Vishnu in the form of a tortoise or Khurma, when the ocean was churned by means of the mountain, Mandara, the serpent Sessa being employed to whirl the mountain round.

RATNAPURA, or the gem city, now called Ava, or Ayn-wa, a town in Burmah, in L. 95° 59' E. and L. 21° 50' N. It was at one time the capital city and it is stated to have been founded in A. D. 1364, by Thado-men bya, prince of Ta-goung, who mastered the kingdoms of Pan-ya and Sa-gain, into which the country was then divided. The first mention made of Ava, by any European traveller; is that by Nicolo di Conti, who was there about 1440 (Ramusio, i, 840.) It continued to be usually the royal residence, with some intervals, till the end of the eighteenth century. In 1526, the Shanraees of Monyin and Mogoung took the city and overran the country, of which they held possession till 1554. In that year, the Toun-goo king of Pegu, Tsheu-byoo-mya-yen (Lord of many white Elephants) conquered Ava and destroyed the city. The king Nyoung-men-ta-ra, who re-established the city and kingdom, after the fall of Pegu in 1601, appears to have been a natural son of the conqueror. Ava was taken by the Peguers during their resumption of independence in 1752. They were speedily expelled by Alompra, but he always resided at Mont-ah-ba. In 1763, on the accession of Tsheu-byoo-yen, Ava again became the seat of royalty. It was, however, abandoned on the

founding of Amarapoora in 1783, and re-occupied in 1823 by the king and queen who entered in great state, accompanied by the white elephant, and by all the dignitaries of the court only to be again deserted in 1837 by Tharawaddi who had vowed to make it a heap of ruins.—*Yule's Embassy*, p. 184. See Buddha; Jain; India; Karen; Kiayn; Lawa; Mangles; Negrais; Nicolo di Conti; Petroleum; Rangoon; Tee.

RATNAPURA in L. 6° 42'; L. 80° 17', a town in Ceylon, 56 miles S. E. of Colombo. Mean height of the village above the sea is 77 ft. Gillemalle village is 112 ft. The great bulk of the gems of Ceylon come from Ratnapura, which means the city of gems. See Precious Stones.

RATNI. SANS. Ell.

RATSAHARA of Beas, Coriaria Nepaulensis.—*Wall*.

RAT SNAKE of Ceylon, *Coryphodon Blumenblachii*, is almost domesticated, and is often kept in households.—*Tennent's Sk.* p. 42.

RATTA. HIND. *Chenopodium*, sp.

RATTA. See Tin.

RATTA-HUNU. SINGH. Chalk.

RATTAN CANE. ENG. *Calamus rotang*, *Calamus fasciculatus*.—*Linn, Roxb.* See Ratan.

RATTANJOG. HIND. *Anemone obtusiloba*.

RATTANKAT. HIND. *Andromeda ovalifolia* and *Rhododendron anthopogon*.

RATTANAS, a species of coarse sacking, made of a long stout fibre in Madagascar, about five feet square, and largely used in the island of Mauritius, to dry sugar on.—*Simmond's Dict.*

RATTI. HIND. *Abrus precatorius*.

RATTL, an Arab weight in Bangalorr, 24 rattl make one maund of 25 lbs., in Travancore 25 rattle or rautel = the maund of 18 lbs. 12 oz. 13 grs.—See Rottolo.—*Simmond's Dict.*

RATUA. HIND, a variety of rice of Amritsar.

RATUN-DASTI. HIND. *Juniperus communis* berries.

RATWA. HIND. *Cervulus moschatus*.—*De Blain*.

RAU. HIND. of Ravi, *Coriaria Nepalensis*, *Wall*, also *Cotoneaster obtusa*.

RAUCHYA. One of the 14 patriarchs who are supposed to preside successively over the 14 Manwantara of the Calpa.—*E. Warren*.

RAUGHAN. HIND. Pers. ghi, butter, grease, fat, oil, balsam, resin.

Ranghan i-badam, almond oil.

" i-baiz-i-murgh, oil of egg shell,

Raaghau-i-balsan, medicinal Balsam, *Balsamodendron Berryanum*.

" i-bhirbute, a medicinal oil for blistering

" i-gul, rose scented oil.

" i-majmus, scented oil, compound scents.

Raughan i-mom, wax oil, medicinal.
i-moty and chambeli, jessamine oil.
i-pin, Dera Ghazi Khan, a medicinal oil,
made of pelican's fat.
safed, ghi or clarified butter.
siya, coarse oil.
i-turb, Balsamodendron Roxburghianum,
gugal resin.

Raughan-i-Bhir Bhuti, oil of the red velvet insect, "bhir bhuti," which appears in the rains; the oil is used only as an irritant and blistering agent.

Raughan-i-Pin, "Pelican oil," is made from its fat; one bird yields a quarter of a seer. The Persian name of the bird is Fitan.

Raughan-i-Baiz-i-Murgh, oil from the shells of hens' eggs, obtained by dry distillation; used in native medicine.

Scorpions' oil, is made by steeping scorpions in oil it is used in medicine and as a cure for scorpion's bites.—*Powell's Hand-Book. Econ. Prod. Punjab*, p. 160.

RAUL, amongst the Mahrattas, a low tribe who weave a coarse cloth and tape.—*Wilson*.

RAULI. HIND. *Litsaea*, sp.

RAULPINDI, L. 33° 36' 5"; L. 72° 59' 8" in the Punjab, a large military station. Mean height of the cantonment, 1,737 ft. *Schl. Rob.*

RAUNG-THMOO. BURM? A wood of Amherst, said to be a kind of teak. It is used for house posts.—*Cat. Ex.* 1861.

RAUNJ. HIND. *Acacia leucophlœa*.

RAUNS. HIND. *Cotoneaster baccillaris*, Indian mountain ash.

RAU PALLEE MARAM. TAM. *Spathodea arcuata*.

RAUSLI or **Rusli**. HIND. A kind of soil same as Maira of Punjab.

RAUSHANAK. PERS. *Cucumis pubescens*.—*Willd. W. & A.*

RAVANA or **Ravan**, a powerful asura, the sovereign of Lanka, or Ceylon (Lanka, Resplendent) destroyed by Rama Chandra. Ravana was the son of Visvarawa Muni by his wife Nikaksha. Another wife of Visvarawa Muni was Brabira, daughter of Trinavindhu, a king of the Solar Line of Vesala, descended from Sradha Deva. He is described with numerous heads and arms, and is said to have become so potent, in consequence of an ill-judged promise (according to some of Siva, and according to others of Brahma) obtained in the usual manner by marvellous religious austerities and devotion, as to have brought all the gods under his subjection. As the promise of the deity could not be revoked, Vishnu found the means of evading the performances of it by becoming incarnate as Rama Chandra to effect this. Ravana is also called Dasagriva, the ten-necked; and, Pulastya; and Visravana as son of Visrava, the father also of Kuvera. His numerous heads, and his twenty hands,

are the usual symbols of dominion. Ravana is seen in plates along with Garuda; this animal, half-bird, half-man is the vahan or vehicle of Vishnu, and is very frequently introduced into the pictures of the vaishnava sect, carrying the deity, with or without Lakshmi; by their sectarists, Krishna and Rama, identified with the preserving power, are also sometimes mounted on this vehicle of their archetype. Another account describes Ravana as the son of the sage Visrava, by Naikasi, the daughter of Sumali, a demon, who, observing the splendour of Kuvera, a son of the sage by his wife Irvira, directed his daughter to propitiate the sage, that she also might have children by him. Having succeeded in obtaining the good graces of Visravas, Naikasi had by him Ravana, Kumbhakarna, and a daughter, Surpanakha. In reality, Ravana, obtained possession of Sita, wife of Rama, and brought on himself an invasion of his island, by Rama, in which Rama was assisted by the uncivilized races of the Dandacarya or forests of the southern part of the peninsula of India. Ravana and his brother were slain. Sita was recovered. The story of the Ramayana recounts this war. A festival is celebrated in honor of Ravan by the Shanar race. Ravana ruled over a powerful and civilized state, which comprised Ceylon and the whole of the southern division of India.—*Moor*, p. 334. *Hero and Nymph*, p. 288. See Avataram; Hanuman; Inscriptions.

RAVA-PU. MALEAL. *Guettarda speciosa*.—*Lin.*

RAVA KADA or **Reyyi Kada**. TEL. *Salsola nudiflora*, R. ii. 60.

RAVANA SURUNI MISALU. TEL. *Spinifex squarrosa*, *Spreng.* This curious diœcious grass called "the sea-pink" is found in great abundance along the Coromandel Coast. When the seed is ripe, the spherical head of the plant is detached and blown about the sands by the wind, illustrating in a remarkable manner "the rolling thing before the whirlwind," of Isaiah xvii. 13 and "the wheel before the wind," of Psalm lxxxiii. 13.

RAVASALA BARTA KADA. TEL. *Phyllanthus bacciformis*, R. iii. 661.

RAVEN. *The Corvus corax* or 'Raven,' has the circut of northern regions; rare in N. Africa, Punjab, Kashmir, Afghanistan; the Tibetan Raven is considered as a peculiar species by Mr. Hodgson, an opinion to which the Prince of Canino seems to incline: it may be presumed to inhabit the lofty mountains of Butan to the north. The smaller crow of Southern Asia is the *C. splendens*, while the common black crow of all India, *C. culminatus*, would seem to stand here alike for the 'Raven,' the 'Carriion Crow' and the 'Rook,' the true Rook (*Corvus*

frugilegus) however, is known to inhabit or visit the Peshawur valley, Afghanistan, and Kashmir. The Rook of China and Japan is considered a distinct species, *C. pastinator* of Gould; and the Jackdaw (*C. monedula*) accompanies it in those countries, while the true northern Raven *Corvus corax* is met with not only there, but also over a great portion of the Punjab. In other parts of India the comparatively small *C. culminatus* is popularly known to Europeans as "the Raven:" but the northern Raven would make a meal of one and not feel much the worse for it. The Raven of Ladak is a larger bird than that of the Northern Punjab, owing most likely to the climate being better adapted to its habits and constitution. Dr. Adams scarcely thinks there are sufficient grounds to consider this species distinct from *C. corax*, the differences in what Mr. Hodgson calls this variety *C. tibetanus*, being only in a somewhat larger size, the wing measuring $18\frac{1}{2}$ inches, tail $11\frac{1}{2}$, and the bill to gape 3 inches. The raven of Tibet has been called *C. tibetanus* by Mr. Hodgson (An. and Mag. Nat. Hist. iii, p. 203) for the reason that it is somewhat larger than *C. corax*.—*Blyth. Adams.*

RAVENALA SPECIOSA, the traveller's palm of Madagascar, has been introduced into India.—*Tennant.*

RAVENSARA-NUTS, the produce of *Agathophyllum aromaticum*, found in Madagascar where they are used as a spice, and from thence occasionally exported to France. The article imported into China, from India, under this denomination is a nut of a dark brown colour, the size of a nutmeg, in smell and taste resembling both cloves and pimento: internally it is divided into cells, and contains a kernel extremely hot and biting to the taste, with a strong spicy smell.—Ravensara is, also, however, the name given to the bark of the clove-cinnamon tree, growing in the Brazils and Madagascar, of which the foregoing is probably the fruit.—*Comp. Descr. Simmond's Dict.*

RAVERTY, Captain H. G. of the 3rd Regiment Bombay Native Infantry, author of a Grammar, Text-Book and Dictionary of the Pukhto or Pushto or Afghan language. London, 1860, also Thesaurus of English and Hindustani technical terms. According to Captain Raverty, the people who dwell about Kabul and Kandahar, Shorawak and Pishin, are designated B'r-Pushtun or Upper Afghans; and those occupying the district of Roh, which is near India, are called L'r-Pukhtun or Lower Afghans. Persian is the official language of Afghanistan, but the Pushto is alike the common tongue of the uneducated people, of the families of the Sadozye kings, and of the dwellings of the amir. There are, however,

he say two divisions of the Afghans, termed Pushtun and Pukhtun, who speak Pushto and Pukhto respectively. The Pushto being the western dialect with affinity to Persian, and the Pukhto the eastern with many Sanscrit and Hindi words. The Pushto is spoken, with slight variation in orthography and pronunciation, from the valley of Pishin, south of Kandahar, to Kafiristan on the north; and from the banks of the Helmund on the west, to the Attock, Sindhu or Indus river, on the east;—throughout the Sama or plain of the Yuzufzye, the mountainous districts of Bajawar, Banjhkora, Suwatt and Buner to Astor, on the borders of Little Tibet,—a tract of country equal in extent to the entire Spanish peninsula: also, throughout the British districts of the Derajat, Banu Tak, Kohat, Peshawar and the Samah, or Plain of the Yuzufzyes, with the exception of Dera Ghazi-Khan, nine-tenths of the people speak the Afghan language.

RAVI. TEL. *Ficus religiosa.*

RAVI OR SURYA, a name of the sun. See *Graha.*

RAVI. AR., a reciter of poems, stories, &c., Hammad Ravi lived in the time of the khalif Walid, his memory was great. He was addicted to debauchery, kalifs Walid and Hisham each gave him 100,000 dirhem, and Mehdi 20,000, but he improvisatized and greatly altered ancient poetry.

RAVI, a tributary to the Chenab river. It rises in lat. $32^{\circ} 26'$, lon. 77° in the Pir-Panjal, or Mid-Himalaya range, to the W. of the Rotang Pass. It runs S.W., about 40 m., then W. to Lahore: and S. W. to its junction with the Chenab, length, 450 m. It receives as affluents the Nye, 20; Sana, 36; Chakki, 50 miles. About 22,000 sq. m. are drained. It has a tortuous course; and is fordable in most places for eight months of the year. The Ravi, is the Hydraotes or Hyarotis of the ancient Geographers, and is the least of the Punjab rivers. Its principal source is said to be a little lake, named Muni-mys. Its name in Sanscrit, is Iravati, in the local dialect Iraoti (the Irrawaddy of the Ayeen Akberi), which doubtless suggested the names of Hydraotes in Arrian, and Hyarotis in Strabo. Ptolemy calls this river Adris. The Ravi continues its intramontane course for about 130 miles, debouching from the plains at Shahpur. The average fall of this portion according to general A. Cunningham, is 115 feet per mile. It is called Rawn, in Bara Bughal and is formed of several impetuous streams, issuing from beneath large glaciers, at an elevation of 14,000 feet on the south side of the Mid-Himalaya, and east and west of large spurs, running from the outer range.

About forty miles below its source, the Ravi proper is joined by two large feeders, the Budhil and the Nai or Duna. Near the head of the river there is not much timber, much having been felled in past times, and the rest consists of trees immature or inconveniently situated.—*Powell*, p. 531. *Cleghorn, Punjab Report*, p. 109. *History of the Punjab*, Vol. I. p. 13-14. See Grahū ; Jamu ; Khetri ; Punjab.

RAVUDANA. TEL. *Dillenia*, R. ii. 652 ; Cor. 20—W. and A. 16.

RAVUNCHENI, also Sirah. HIND. Gamboge.

RAWADARU. TEL. Syn. of *Dillenia pentagyna*.—*Roxb.*

RAWA-KADA. TEL. Syn. of *Salsola nudiflora*.—*Willd.*

RAWAL, the titular appellation of the chief priest of the temple of Badarinath in the Himalaya. He is always a Namburi brahman from Malabar. Rawal, is also a title of some Rajput princes as the Rawal of Bhownagar, or Raoul, the title once was that of the Mewar house, is yet borne as a princely title by the Aharya prince of Dongurpoor, and the Yadu prince of Jeysulmer whose ancestors long ruled in the heart of Scythia. Raoul seems to have been titular to the Scandinavian chiefs of Scythic origin. The invader of Normandy was Raoul, corrupted to Rollon or Rollo—*Tod's Rajasthan*, Vol. I. p. 213, Vol. II. p. 237. See India ; Kedarnath.

RAWAL of the Wagri, *Circaetus gallicus*.—*Gmel.*

RAWAL PINDEE is about sixty-eight miles east of the Indus, it is well known as a British cantonment.—*Cal. Rev. Jan.* 1871. See Kabul ; Raulpindi.

RAWALA, the Rawala of a hindu prince is a world, within itself, and resembles the mahomedan harem. It is the labyrinth containing the strings that move the puppets which alarm mankind. Here intrigue sits enthroned, and hence its influence radiates to the world, always at a loss to trace effects to their causes.—*Tod's Rajasthan*, I. p. 464.

RAWAN. HIND. *Lathyrus aphaca*, also *Dolichos uniflorus* and different kinds of pulse.

RAWAN, H'RAD. See Indus.

RAWANA or Rama. *Spinifex squarrosus*. See Ravana Suruni.

RAWANAH. HIND. An invoice, a custom house permit or pass for a certain quantity of opium, spirits, &c.

RAWAND-CHINI or Rewa, or Rewand, also Sirah. GUZ. HIND. Rhubarb.

RAWANG. ARAB. Rhubarb.

RAWANG. ARAB. Rhubarb.

RAWARI. HIND. *Lathyrus aphaca*.

RAWASAN. HIND. *Dolichos sinensis*.

RAWASH. HIND. *Rheum emodi*.

RAWAT also Rāji, a small savage tribe in the Rohilcund Terai ; also a wandering uncivilized tribe in Kumaon 20 or 30 families are occupants of the forest of Kumaon, who claim to be descended from a prince of Kumaon who was driven from his throne. Their language is dissimilar to the Hindui of Kumaon. The Rawat are considered to represent the aborigines of the district.—*Latham. Mr. Campbell*, p. 47. See Haiyu ; Chetang.

RAWAUN. Bussahir is a tributary state, gave Rs. 3,945 as tribute. Rawan, on the left bank of the Pabur was transferred to Keonthul. The thakoorai of Kotegurh and Koomharsein were declared independent of Bussahir.

RAWD. See Mesopotamia.

RAWE. JAV. Cowage.

RAWI. See Chepang.

RAWKUS GUDDA. HIND. *Bryonia epigæa*.

RAWLINSON, Sir Henry Creswicke, K. C. B., rose to be Lieut.-Colonel in the Bombay Army, was member for Reigate, he, in 1858, deciphered the cuneiform inscriptions of Assyria, Persia, and Babylonia. He was born in Chadlington in 1810. He entered the military service of the East India Company in 1826, and served in the Bombay Presidency until 1833, when he was appointed, with several other officers of his own standing, to the army of the king of Persia, in which country he served until 1839, having obtained the local rank of Major. He was appointed Political Agent at Candahar, in 1840, and held that position through the Afghan war. In 1843, he was transferred to Bagdad as Political Agent in Turkish Arabia, where he subsequently became British Consul, and eventually Consul-General. In 1851, he was made Lieut.-Colonel in Turkey. He was Ambassador to Persia. For his contributions to antiquarian and scientific knowledge he was made a Fellow of the Royal Society and Honorary D. C. L. of Oxford, a Chevalier of the Order of Merit in Prussia, a Corresponding Member of the Institute of France, an Honorary Member of the Academy of Munich, and a Member of the Geographical and Asiatic Societies of Germany and of numerous other literary and scientific associations. He was also made a Knight of the First Class of the Persian Order of the Lion and Sun for his services in that country, whilst his services in Afghanistan were recognized by the bestowal of the Knighthood of the Durani Empire, and he was made a Military Companion of the Bath

for his services in Candahar. He assisted Sir J. Gardner Wilkinson in a new translation of "Herodotus," by his brother, the Rev. George Rawlinson, and is author of a work on the comparative Geography of Affghanistan. He wrote a series of papers on Assyrian Antiquities and the cuneiform character from 1850 to 1852. On the arrow-headed character found in the ruins of Persepolis, and on bricks and stones in the ruins of Babylon and Nineveh, and the celebrated inscription near Hamadan on the Besitun was deciphered by colonel sir Henry Rawlinson, and another by professor Grotefend.—*Ferrier's Hist. of Afghans*, p. 371. *Geo. Trans.* 1842, Vol. XII, part 2, p. 112. *Royal Geographical Journal. Journal of the Royal Asiatic Society of London.*

RAWUN RUDD LAKE. See Kunawer.

RAY. HIND. ? A tree of Chota Nagpore, furnishing a hard timber.—*Cal. Cat. Ex.* 1862.

RAYA in the dialect of the south of India, a prince : also a usual name amongst the Telinga race, as Jesul Raya Pillay.

RAYA DASI. See Hindu.

RAYAH or Rayap, MALAY. White ants.

RAYAKOTTA, in L. 12° 31' ; L. 78° 3' in the Karnatik, 12 miles S. of Saulgherri. It is 2,449 feet above the sea.—*Scott.*

RAYA MANU. *Ficus religiosa*.—*Linn.*

RAYAP. MALAY. White ants.

RAYAVATA. One of the 14 patriarchs who are supposed to preside over the 14 Manwantara of the Calpa, and whose anniversaries are noticed in the Calendar.

RAYEE. TEL ? A tolerably plentiful tree of Ganjam and Goomsoor, which attains an extreme height of 30 feet and a circumference of 3 feet. The distance from the ground to the outer section of the first branch is 15 feet. It is only used for firewood.—*Captain Macdonald.*

RAYEDURU DUMPA, also Goru Chutugadda. TEL. *Eulophia virens*.—*R. Br.*

RAYAT LAUT, a seafaring race of the Indian Archipelago, adventurous navigators. The Rayat Laut, subjects of the sea, or Orang Akkye, are unquestionably from the same stock as the Jakun. The two tribes, are expert divers, and fishermen, and frequently make long voyages in their fragile vessels. Otherwise they reside along with their families in their boats for months together, employed in fishing, collecting Agar-agar Tripang, &c. the Rayat Laut have but faint ideas of the existence of a benignant superior Being, and of a state of future existence ; in appearance, they resemble the Jakun and Malay, allowing for the physical alteration always induced by difference of food, daily occupations, and habits, especially when continued through many generations. They are darker

than the Malay, more savage and uncouth in aspect.—*Newbold's British Settlements, Vol. II. pp. 411, 412, 413.* See Kedah or Quedah.

RAYKABEEAN. HIND. Saucers.

RAY, a cartilaginous fish in which, although the skeleton is not osseous, the development of organs is so advanced that they would appear to be the highest of the class.

Raja Narinari, *Bl.* the *Aetobates narinari*, *Mull* has a produced snout, pointed and winged like pectoral fins, and an exceedingly long tail, armed with a strong, serrated spine, which is always broken off by the fishermen immediately on capture, under the impression that wounds inflicted by it are poisonous. Like most deep sea fishes, the ray has a wide geographical range, and occurs not only in all the Indian Ocean, but also in the tropical tracts of the Atlantic.—*Tennent's Sketches of the Natural History of Ceylon*, p. 328.

RAYMOND, a French officer in the service of Nizam Ali, Nizam of the Dekhan. In March 1795, with 18,000 men, he met the Mahrattas at Kurdla, with 130,000 horse and foot, and 150 pieces of cannon, and was completely defeated.

RAYYI PAPPU, also Jaji. TEL. *Grislea tomentosa*.—*Rox.*

RAZAI, a counterpane quilted with cotton.

RAZAQ. PERS. Food.

RAZBAM. HIND. *Lonicera quinquelocularis*.

RAZEEANUJ. ARAB. *Fœniculum panmori*.—*D. C.*

RAZI. JAV. *gu.* Rassi, ARAB, a ferment used in Java in the distillation of the fermented liquor called Badek.

RAZZIA, the heiress of the great Feroz, an intrepid but unfortunate queen, she was compelled to abandon her throne by an usurper, and sought and found a protection amongst the Jit, who with their Scythic brethren the Ghikar assembled all their forces and marched with their queen at their head, like Tomyris of old, to meet her foes : but she fell, in battle, in her attempt to overturn the Salic law of India.

RAZEE-NAMA, an acquittal, literally, "a deed of consent or acquiescence."—*Malcolm's Central India, Vol. II, p. 292.*

RAZIANUJ, ARAB. Fennel seed.

RAZIAN-I-RUMI. PERS. *Pimpinella anisum*. Aniseed.

RE. HIND. *Abies Smithiana*, *Picea Webbiana* ; bang re, and kand re, is *Abies Smithiana* ; kul re, is *Picea Webbiana*, or Himalayan spruce.

RE, also Ravi, also Ragi, TEL. *Ficus religiosa*.—*Linn, Roxb., Ph.*

RE or Rey, the Rhages of the Bible, the ruins of which are situated a little to the south

of Teheran. All Oriental writers agree upon its antiquity, and it is called "the mother of cities." It was once a very large place, the capital of the Jabbal (the hills), and very rich and flourishing; but it was destroyed, and the inhabitants were put to the sword by the Tartars at the beginning of the seventh century of the Hijra.

RE. TEL. *Ficus religiosa*.—Linn.

REALGAR. Red orpiment; Red Arsenic.

REAM, 20 quires of paper of 24 sheets each = 480 sheets. A printer's ream is $21\frac{1}{2}$ quires, or 516 sheets.

REAMAN or Raimane. TEL. *Ficus religiosa*.

REANG, a half breed between the low Tipperah tribes and the Kuki.—*Cal. Rev. No. cxx. December 1860.* See India.

REAUMERIA HYPERICOIDES, is a native of Syria and Persia and *R. Vermiculata*, a native of Sicily, Bombay, and Egypt. This plant resembles *Salsola fruticosa*. It is used at Alexandria as a remedy for the itch, being bruised and applied externally, and a decoction taken internally.

REBARI. Throughout Hindusthan, the Rebarri are persons employed in rearing and tending camels, and are in many places mahomedans. In Rajputanah they are a distinct tribe following hinduism, employed entirely in rearing camels or in stealing them, in which they evince a peculiar dexterity, uniting with the Bhatti in the practice as far as Daodpotra. When they come upon a herd grazing, the boldest and most experienced strikes his lance into the first he reaches, then dips a cloth in the blood which at the end of his lance he thrusts close to the nose of the next, and wheeling about, sets off at speed followed by the whole herd, lured by the scent of blood and the example of the leader. The Rebarri of Guzerat are nomade shepherds, who rear camels, sheep and goats and subsist by the sale of the wool and milk and not of the animals.—*Tod. Wilson.*

RECCAN or Rakan River, on the Sumatra coast, in lat. $2^{\circ} 10' N.$, long, $100^{\circ} 37' E.$, is about 15 miles broad at its mouth, but is almost dry at low water of spring tides. It is dangerous from the rapidity of 7 miles an hour producing a bore at springs and a rise of 30 feet.

RECHUK. BENG. *Croton tiglium*.

RECORDER, the Chief Justice of Singapore, Rangoon, Moulmein.

RECURVIROSTRIDÆ. A family of birds comprising 2 gen. 3 sp. 2 Himantopus; 1 Recurvirostra avocetta. The 'Avocet,' which inhabits Europe, Asia, all Africa: not rare in India.

RECRUITS for the Army of Britain for 1869 showed in that year 17,749 recruits offering themselves for enlistment in the United Kingdom, were medically inspected—13,128 Englishmen, 282 Welshmen, 1,312 Scotchmen, 2,901 Irishmen, 126 born beyond the seas, 6,660, or 375 per 1000 were rejected. The Glasgow recruiting district continued to show the highest proportion of rejections, and in Bristol and Liverpool it was considerably above the average; Belfast had the lowest ratio of rejections. Diseases of the eyes and eyelids formed the most cause of rejection. There was a marked increase in 1869 in the proportion rejected for muscular tenuity and debility, which now holds the second place in point of frequency as a cause of rejection. Disease of veins (varix), malformations of chest and spine, defects of lower extremities, disease of the heart, and varicocele follow in succession. There was an increase in the rejections in the classes of manufacturing artisans, and of shopmen and clerks; and the ratios are higher than among labourers, husbandmen, and servants, a class which furnished 502 in every 1,000 recruits; 789 in 1,000 were able to read and write; 183 could do neither; 78 could read but not write. Upwards of half the recruits inspected were between 5 ft 6 in. and 5 ft. 8 in. Of the recruits inspected at head-quarters of recruiting districts 1,387 in 10,000 did not weigh more, than 120lbs.; 5,606 from 120lbs. to 140lbs.; 3,000 from 140lbs. upwards.

RED.

Lal.....HIND. | Erra.....TEL.
Abang.....MALAY.

Red is one of the primitive colours, of which the chief commercial varieties are fine venetian, red lead, orange, Indian, red and vermilion. The colour seems to be esteemed sacred in many instances by those who inhabit a great portion of Asia; from China to Caucasus; from Tibet and Butan to the extremity of India, and to Ceylon.—*Ouseley's Travels, Vol. I. p. 87.*

REDANG ISLAND, from lat. $5^{\circ} 38' N.$ to about lat. $6^{\circ} N.$, on the east coast of the Peninsula, along which they form an extensive chain. Turtle and Kimor or large scollops are procurable on the N. E. side.

RED ARSENIC, Red Sulphuret of Arsenic. See Arsenic.

RED CEDAR or Pencil Cedar. See Cedar.

RED CLOVER. See Clover Seed.

RED-COLORED WOODS. See Forests of Timber in India. Red-wood.

RED COTTON TREE, Bombax Malabaricum, common throughout Southern India, is abundant in the plains of British Burmah, and

its light and loose grained wood is there used for coffins.

RED-DEER. *Cervus Wallichii*, *Cuv.*

REDDI. TAM. TEL. The head of the village authorities in Southern India. The name is applied to an enterprising race of agriculturists who have migrated from their original seats near Rajahmundry, over the whole of Southern India, also into Maharashtra, being met with as far North as Poona, where they are considered the most thriving cultivators. Among the Reddi of Southern India, a very singular custom prevails. A young woman of sixteen or twenty years of age may be married to a boy of five or six years. She however lives with some other adult male, perhaps a maternal uncle or cousin, but is not allowed to form a connection with the father's relatives, occasionally it may be the boy husband's father himself, that is the woman's father-in-law; should there be children from these liaisons, they are fathered on the boy husband. When the boy grows up the wife is either old or past child-bearing, when he in his return takes up with some other "boy's" wife in a manner precisely similar to his own and procreates children for the boy husband.—*Shortt, Trans. Ethn. Soc. New Series, Vol. VII, p. 194—Lubbock. Orig. Civil, p. 55.*

REDDI BUMMALA WANLOO. TEL. People of the Reddi caste.

RED FISH. Fish Roes and Sardines are, in the Malay peninsula, made into condiments and the species of fish used in their preparation, are *Alausa toli*, (*Ikan truboh*), *Engraulis brownii*, (*Bunga ayer* or *badah*), *Dussumieria acuta* (*Tamban-bulat*) and *Clupeonia perforata*, (*Tamban-nepes* or *batuh*.) *Engraulis brownii*, Gmelin inhabits the sea and estuaries of all seas. Total length 6 inches. In Java, Sumatra and the Straits of Malacca, large quantities are preserved both for home consumption and exportation to China and India. The delicious condiment is famed under the denomination of "Red fish," (*Ikan merah* of the Malays,) or "Malacca fish," and is used as a relish. The following mode of preparation, as practised at Bencoolen and Malacca, was communicated by W. T. Lewis, Esq. Asst. Res. Counsellor, Penang. After the heads have been removed, the fishes (those of middling size are preferred), are cleansed, salted (in the proportion of one to eight parts of fish), and deposited in flat glazed earthen vessels. In the latter they are for three days submitted to pressure by means of stones placed on thin boards or dried plaintain leaves. The fishes are next freed from salt and satu-

rated with vinegar of cocoa palm toddy, after which are added powdered with ginger and black pepper (the latter mostly entire), and some brandy and powdered "red rice." After having been kept for three days, a little more vinegar is added before placing the fishes in well closed jars or bottles. They should be kept four or five months before being used. The expenses of a quart bottle of the condiment is about 30 cents, the selling price one Spanish dollar. The Chinese settlers in the Straits prepare a similar red condiment with slices of *Polynemus indicus* and *P. tetradactylus* and also with prawns.

RED FLOWERED WATER LILY, *Nymphaea rubra. Roxb.*

RED GOURD. *ENG. Syn. of Cucurbita maxima.*

RED RATAN. *Calamus draco.*

RED RICE is the variety of *Oryza sativa* called *glutinosa* the pulut, or *brasse pulut* of the Malays, steeped in an infusion of cochineal. In the Straits Settlements red rice is imported from China, and sells at the rate of 10 cents of a dollar per lb.

RED ROBIN, also red gum. See Rust.

RED SAND, of Cape Comorin, is a kind of small garnet, may be interesting, and probably useful for polishing gold and silver, as it is much used by the Natives for that purpose. Other sands from the same locality, are objects of curiosity, the white resembling grains of rice. The whole beach to the westward of Cape Comorin, to the extent of several miles, is generally covered at different seasons with red sand, and immediately on the opposite side, to the eastward, almost entirely with black sand—*M. C. C.*

RED SANDERS WOOD. *Pterocarpus santalinus*.

RED SEA, or Arabian Gulf. The earliest route between Europe and India, of which there is any record in the works of Pliny, Herodotus, Strabo and others, was by the Red Sea. Even before the building of Troy, spices, drugs, and many other kinds of merchandise were sent from the east by this route. The ships coming from the Indian seas landed their cargoes as Arsinoe, the modern Suez, from whence they were carried by caravans to Cassou, a city on the coast of the Mediterranean. The distance from Arsinoe to Cassou was about 105 miles. It is said that on account of the great heat the caravans travelled at night only, directing themselves by the stars, and by landmarks fixed in the ground. According to Strabo, this route was twice altered, in search of a more commodious one. India seems to have been known to the Greeks only as a country, which, by sea, was to be reached by the way of the Euphrates, and the Persian Gulf; and though Scylax had, by the order of Darius, dropped down the river Indus, coasted Arabia, and thence reached the Red Sea, this voyage was either forgotten or disbelieved, and in the time of the Ptolemies it seems probable that nobody thought that India could be reached by sea from Egypt, and Eudoxus of Cyzicus in Asia Minor came to Alexandria to persuade Euergetes to give him the command of a vessel for this voyage of discovery. A vessel was given him; and though he was but badly fitted out he reached a country, which he called India, by sea, and brought back a cargo of spices and precious stones. He wrote an account of the coasts which he visited, and it was made use of by Pliny. But it is more than probable the unknown country called India, which Eudoxus visited, was on the west coast of Africa for Abyssinia was often called India

by the ancients, and all east of the Euphrates was also known as Hind or India.

The Hebrew name of the upper part of the Red Sea meant the Sea of Sedge. In a communication to the Royal Geographical Society, Captain Burton gave his reasons for believing that the Greeks borrowed their Erythrean Sea from the Arabic Sea of Himyar. The Erythrean sea was a name, which seems to have been some part of India. (*Pliny, lib. vi. cap. xxii. and xxiv.*) applied to the Indian Ocean as well as to the two gulfs, the Red sea and Persian gulf, which it forms on each side of Arabia. Herodotus does not particularly distinguish the Persian Gulf, but includes the Arabian sea and part of the Indian Ocean, under the general name of Red or Erythrean Sea. And Pliny styles the Persian Gulf "a bay of the Red Sea." Greek and Roman authors, however, generally used the term "Persian Gulf," but it appears also among them as the Babylonian Sea, and, the Erythrean Sea, and this has caused a confusion with the "Red Sea." The Persian Gulf, by many, is described as the "Green sea" also in Eastern manuscripts as the Sea of Fars or Pars, the Sea of Oman, the sea of Kirman, Sea of Katis, Sea of Basrah, deriving these and other names from the adjoining provinces and from remarkable places on its Arabian and Persian coasts. The origin of the term Red Sea or Erythrean Sea is deemed by many moderns, to be doubtful. M. Ehrenberg, while navigating the Red Sea, observed that the occasional red colour of its waters was owing to enormous quantities of a new animal, which has received the name of *Oscillatoria rubescens*, and which seems to be the same with what Haller has described as a purple conserva swimming in water; yet Dr. Bonar, in his work entitled "The Desert of Sinai" records:—Blue I have called the sea, yet not strictly so, save in the far distance. It is neither a red nor a blue sea, but emphatically green,—yes, green of the most brilliant kind I ever saw. This is produced by the immense tracts of shallow water with yellow sand beneath, which always gives this green colour to the sea even in the absence of verdure on the shore or sea-weeds beneath. The blue of the sky and the yellow of the sands meeting and intermingling in the water, form the green of the sea; the water being the medium in which the mixing or fusing of the colours takes place." It is however from the *Trichodesmium erythraeum* a filamentous alga that the Red Sea is supposed to have obtained its name. It is of a blood red colour often covers large areas, and appears and disappears, somewhat capriciously. It has, as synonym, *T. Ehrenbergii*. *T. Hindsii*, also of a blood red colour, has been found off the west coast of

S. America. Under the microscope the *Trichodesmium* seems sheaves of minute fibres. Dr. Collingwood however mentions that he had never seen red *Trichodesmium*, or any tint of red. He had seen it yellowish brown. He had seen the Indian Ocean red from myriads of minute red Crustaceæ, and in the Formosa channel from red gelatinous worms but never by *Trichodesmium*.

There is no precipitation in the Red Sea ; it is also a rainless region ; not a river runs down to it, not a brook empties into it, therefore there is no process by which the salts and washings of the earth, which are taken up and held in solution by rain or river water, can be brought down into the Red Sea. Its salts come from the ocean, and the air takes up, from it, in the process of evaporation, fresh water, leaving behind, for the currents to carry away, the solid matter which, as sea water, it held in solution. Its winds are either northerly or southerly. The wind from May to November is northerly and the other six months is southerly, but there are also land and sea breezes. It has a rainless tract in that part where the dry N. E. trade wind crosses it. The Red Sea was long supposed to be 36 feet higher than the Mediterranean, and the Persian Gulf rather less. The French Engineers also, at the beginning of the present century, came to the conclusion that the Red Sea was about thirty feet above the Mediterranean ; but the observations of the late Mr. Robert Stephenson, the English Engineer, at Suez ; of M. Negretti, the Austrian, at Tineh near the ancient Pelusium ; and the levellings of Messrs. Talabat, Bourdaloue and their assistants, between the two seas, have proved that the low-water mark of ordinary tides at Suez, is rather more than one inch lower. Mr. Morris, Chief Engineer of the Oriental Company's steam-ship "Ajadaha," collected specimens of the Red Sea water all the way from Suez to the Straits of Babelmandeb, which were afterwards examined by Dr. Giraud, who reported the following results in 1000 parts:—

No.	1. Sea at Suez ..	Lat- tude.	Longi- tude.	Spe- Gr.	Saline Contents.
1.	Sea at Suez	1,027	41.0
2.	Gulf of Suez ..	27°19	33°45	1,026	40.0
3.	Red Sea ..	24°29	36	1,025	39.2
4.	do ..	20°55	38°18	1,020	40.6
5.	do ..	20°43	40°03	1,024	39.8
6.	do ..	14°34	42°43	1,024	39.9
7.	do ..	12°39	44°45	1,023	39.2

These observations show that the surface waters at the head, are heavier and saltier than the surface waters at the mouth, of the Red Sea.

M. Courbon found an immense basaltic wall at Edd, built by nature, the whole country being of volcanic formation. The island of Perim is trachytic ; the culminating points of the island reach an elevation of 228 feet, and prove that the island itself is the result of

a volcanic eruption under the sea. The lava had first raised up the large bank of Madre-pore which covered the bottom, and had then forced its way through the interstices, and become visible over the water. This volcano, the vast crater of which embraced the bay of Perim, in course of time covered the new island with mud, ashes, trachytic blocks, &c., and then became extinguished. Among the specimens brought by M. Courbon was a new species of the genus *Gymnodactylus*, a Saurian, to which M. Valenciennes has given the name of *Gymnocephalus*. There were also two species of fish, the *Cyprinodon lunatus* and *Cyprinodon dispar*, which M. Courbon had fished in a lake near Massuah, the waters of which marked as much as 111 degrees of Fahrenheit. This was the first instance on record of *Cyprinodons* living in such warm water. A third kind of fish, inhabiting the rivers of Abyssinia, and belonging to a genus of which a single species only has as yet been met with in Java, M. Valenciennes has called *Balitopa pusilla*.—*Maurj's Physical Geography*, p. 123, 247. *Burton's Pilgrimage to Meccah*, Vol. I. p. 288. *Ouseley's Travels*, Vol. I. p. 163. *Ajaib at Baldan*. *Pliny, lib. vi. ch. xxiii. and xxiv. Curiosities of Science*, page 176. *Sharpe's History of Egypt*, Vol. I. p. 403. *Collingwood's Voyage of a Naturalist*. *Leonard Horner, in Proceedings of the Royal Society of England*, 1855.—See India ; Kulzum ; Musiris ; Semitic races ; Tehama ; Iran ; Kishm ; Perim ; Periplus ; *Trichodesmium*.

RED SNOW. See Snow.

RED SORREL, *Hibiscus sabdraiffa*, Linn. See Hibiscus.

RED START. The white-capped redstart, *Ruticilla leucocephala* must not be confounded with the chesnut bellied or Guldenstadt's redstart, *R. erythrogastra*, a native of the more alpine regions. The first is distinguished from the other by having the basal portion of the wing quills black.

Associated with the white-capped redstart is frequently observed another and smaller species, the plumbeous or sooty redstart, *R. erythrogastra fuliginosa*, a diminutive little creature seen hopping around and vibrating its tail, which it spreads out like a fan. It is not more than five inches in length. The black Indian redstart frequents gardens.

RED ARSENIC.

Hung.—Siu..... CHIN. | Hung-sin-Shih... CHIN.

A heavy crystalline mineral.

RED SULPHURET OF MERCURY. Cinnabar.

RED SWEET YAM. See Guranyo aloo.

RED TAMARISK. *Tamarix dioica*.

RED TOURMALINE. See Tourmaline.

RED WOOD is a commercial term applied to several timbers, viz., the *Cæsalpinia sappan*, *Linn*: another red wood tree is the *Adenanthera pavoniua*, a large and handsome tree, and well suited for planting in avenues, also to the *Pterocarpus santalinus*, *Roxb*, and the red wood of the Andamans, is said to be the product of *Pterocarpus dalbergioides*. *Roxb*.

The red wood fig tree, is the *Ficus racemosa*.—*Linn*.

The red wood of Japan, Fa-ang, JAP. also Tsiampan, JAP. is a product of Coy or Kiu, in Thunberg's time, belonging to the king of Siam. It was also obtainable in Bambilliso, on the coast of Cambodia, and from Bimen island, between Bali and Timor. It was imported into Japan, where, Thunberg remarks, "this wood rubbed with some lime and water, yields the finest violet colour we could wish to see."

The red wood of Mergui is the *Syndesmis Tavoyana*.

The red wood of the English in Penang is in general use for furniture. Its colour is red, and its specific gravity 1,000.

A red dye wood occurs in the Vizianagrum zemindary. The red wood used in Japan for dyeing, called Ubar, is a red wood of Sumatra resembling logwood. It is used by the natives in tanning twine for fishing nets, and appears to be the okir or Tanarius major of Rumph, Vol. III., p. 192, and Jambolifera rezinoso of Lour. Fl. C. C. p. 231.—*Marsden's Hist. of Sumatra*, p. 95. *Thunb. Hist. of Japan*, Vol. 1. p. 42-43. *Col. Frith*.

REEAZUT, penances, mortifying the flesh.

REECH SHAH, a mohurru fuqueer.

REED.

Baroo... .. HIND. | Pedda relloo TEL.
Peroo nanal TAM.

Reeds of the best quality of which pens are made are imported into India from Arabia, but inferior descriptions from *Saccharum sara*, abound on many hills and on the banks of rivers in India. Reeds for weaving are formed of these, though used also for pens. In Peninsular India, reeds for weavers are constructed by a class of persons, who also practice as oculists, the materials used for reeds are strips of several descriptions of reed: for silk weavers they are made of the fine teeth of the mango fish.—*Rohde's M.S.S.*

REED FERN. See Ferns; Polypodium.

REEDUNG. See Kunawer.

REEFS. Coral islands are arranged by Darwin into the Atoll or lagoon island, a coral margin with a lagoon in the centre; Barrier reefs, stretching along a vast extent of coast; and coral reefs which are merely fringes of coral along the margin of a shore. Von Birch is of

opinion that the lagoon island is the margin of a submarine crater on which the coral animal has built its wonderful structure. The barrier reefs according to Darwin are due to subsidence. In a sheltered archipelago, they rarely rise to the surface. But in an open ocean, rolling waves and breakers throw up a barrier of broken coral, far above the usual high water mark. One such coral reef is known 1,062 miles long, with an average breadth of thirty miles, giving a surface of 31,860 square miles. There are innumerable coral reefs and coral islands, but Mr. Darwin's essay on the Structure and Distribution of Coral reefs has satisfactorily shown that "Atolls" or annular reefs were originally fringing reefs constructed around islands that have since subsided. Coral reefs have thus been divided into three classes according to their geological character; The shore reefs fringe the shores of continents or islands: the encircling reefs or barrier reefs; the third, enclosing a lagoon is called an Atoll, or lagoon island, and is a ring or annular breakwater around an interior lake. the encircling reef of New Caledonia is 140 miles beyond the island. In the Eastern Archipelago and the Pacific ocean, are many Coral Islands or Atolls. An atoll differs from an encircling barrier reef only in the absence of land within its central expanse; and a barrier reef differs from a fringing reef in being placed at a much greater distance from the land with reference to the probable inclination of its submarine foundation, and in the presence of a deep water lagoon-like space or moat within the reef. Atolls sometimes constitute a great circular chain enclosing a deep basin: but opening by one or more deep breaches into the sea. Sometimes they surround a little island by a girdle of reefs; or form the immediate edging or border of an island or continent. Atolls occur in the Pacific, in the Chinese Seas, in the Marianne and Philippine Islands, Maldives Laccadives, and Sunda group.—*Darwin, on the structure and distribution of Coral Reefs. Hartwig*.

REEPERS are longitudinal sections of the palmyra palm, used for building purposes; the trunk of the tree is split into eight for reepers, and these are dressed with an adze. In Ceylon they are made of the kittool palm, and known as Nipera reepers; these are dearer than any other kind, they last, in many instances, for 50 or 60 years.—*Simmond's Dict.*

REETHA HIND. *Sapindus emarginatus*, *Vahl*, also *Sapindus detergens*.

REETHA. BENG. Soap berry, *Acacia rugata*, syn. of *Acacia concinna*.

REFE. IR. Thread.

REFUGE CITIES. Cities where criminals and others could obtain refuge. See Bast; Hebron; Kedish; Shechem.

REG. PERS. Sand, hence Registhan, a sandy desert, the Baloo-Desa of India : Reg-rawan, the moving sand.

REG. See Greeks of Asia.

REGA. TEL. *Rhamnus jujuba*.

REGALIZ, also Obozuz. SP. Liquorice juice, Liquorice root.

REGAN. See Kirman.

REGDAWAN. HIND. PSHTU. *Recoma undulata*.—Wall, II. 54.

REGELTA HIND. *Tamarix dioica*.

REGENCY, in Java, a paid native chieftancy.

REGENERATOR. See Linga ; Siva.

REGENT BIRD of Australia, is the *Sericulus melinus*. It builds its nest in bowers like the satin bird and bower bird.

REGI. HIND. Kuhat, a sandy soil.

REGISTHAN, an open space strewn with sand. Also the sandy desert or baloo-Desa of India.

REG MAHI, a small mottled lizard, *Lacerta scincus*, *Linn.* from 6 to 8 inches in length, found in the sands of Sindh and occasionally in dry tracts of the Multan division. This animal used to be formerly in the *Materia Medica* of Europe as a restorative stimulant, and antisyphilitic ; even some modern physicians have, however, justified the use of these animals.

REG RAWAN, or moving sand, is a hill in the Kohistan of Kabul, remarkable for a bed of sand on its southern face. This is subject to sliding movements, which occasion sonorous sounds. It is styled the Khwaja Reg-rawan, and is forty miles north of Kabul, near the foot of the Indian Caucasus. Burnes describes the sounds heard there as loud and hollow, very like those of a large drum, whilst sultan Baber speaks of the sounds of drums and nagarets, and the same instruments were specified by Odoric. A still more apt comparison is afforded by Captain Newbold's account of the like phenomenon in the Sinai desert, at the sand hill known as Jabal Nakus, "the Hill of the Bell." Dr. Wallin also was told when crossing a Wadi of the Sinai desert called Hamade, near Wadi Araba, that sometimes very strange sounds, like those of kettle drums or nakkara, were heard to rise from the earth, without any discoverable cause. Friar Odoric gives an account of a sandy hill, on which he heard the sound of invisible nakkara or drums. Mr. C. R. Markham says the musical sounds caused by moving sand, which astonished Odoric, are heard also in the deserts of the west coast of Peru. Mrs. Markham and himself heard them when they halted amidst the medano or hills of light sand in the Arequipa Desert. Another case was discovered by the late Hugh Miller in the Island of Eigg (Cruise of the Betsy, quoted in Petermann's *Mittheilungen*, 1858, p. 405.) Mr. Bollaert in his notice

of the Bramador or Rumbling Mountain of Tarapaca, says the mountain of Tarapaca appears to be an instance distinct from Mr. Markham's—*J. G. S.*, xxi, 104, quoted in *Yule Cathay*, I. p. ccxlv.

REG-TILA. HIND, sand containing gold.

REGU CIETTU or Gunga Regu. TEL. *Zizyphus jujuba*, *Lam.*

REGU RAKU TIGE. *Hircea Indica*. R. ii, 448—*lc.* 381.

REGUTTI or Gullem also Guli. TEL. *Caparis grandis*, *L.*

REGULUS CRISTATUS. 'Golden-crested *Regulus*,' of Europe, N. Asia, Japan, W. Asia, Barbary : partially migratory, is replaced in the W. Himalaya by *R. himalayensis*.

REGULOIDES PROREGULUS. The *Regulus modestus*, or 'Dalmatian *Regulus*' of Asia is very rare in Europe : one specimen obtained in Dalmatia and another in England. Common in India with several affined species. See Birds ; *Phylloscopus albogularis*.

REH, HIND ; a deterioration of the land irrigated from the Ganges and Jumna canals which first attracted serious attention in the villages along the Western Jumna canal, and its branches, about Delhi, Paniput, Rohtak, and Karnal. In 1857, Mr. Sherer, Joint-Magistrate of Allypore, went on a deputation to examine the tracts of country deteriorated, and the picture presented by him of the suffering in some of the villages was truly deplorable. Out of 580 canal villages, 59, or nearly 10 per cent had been injured in degrees ranging from severely to partially, 6 per cent being severely injured. The maximum appeared to be reached in Paniput where 46 villages, or 19 per cent were injured. The saline substance effloresces in several parts of the Punjab, where there are no canals at all ; in these places it appears in land irrigated from wells where the water is very far from the surface. The efflorescing salt consists of sulphate of soda with a variable proportion of chloride of sodium or common salt. Mr. Medlicott, found in a sample soil from near the Western Jumna canal, 76 per cent. In some of the instances given by Dr. O'Shaughnessy, the per-centage is much higher ; at Jagu, in Paniput, it was 20 per cent. As far as experience goes, lands near canals, like the Hasli, in the Lahore district, constructed at, but not below, the ordinary level of the water shed, are usually found to be free from Reh efflorescence. Generally speaking the farmers assert that fully impregnated Reh land is incurable and valueless. In gardens and small plots, it has been found useful to dig out the soil to the depth of 2 feet or so entirely, and putting in fresh soil. Nitrate of Lime as a manure is recommended. Whether

this can be made conveniently and cheaply, remains yet to be seen.

REHAN. HIND. *Ocimum basilicum*.

REHANI. HIND. A 3rd quality of rice, which grows in the Simla states, &c.

REHAT, in buddhism, a being entirely free from evil desire, and possessing supernatural powers.—*Hardy's Eastern Monachism*, p. 440.

REHL. See Sarug.

REINE. HIND. *Rottlera tinctoria*.

REINE KOHLE. GER. Charcoal.

REISH SAFED or Resh-safed. PERS. literally, white beard, the elder or superior of a village.—*Fraser's Journey into Khorasan*, p. 208.

REJANG is the alphabet of Leimba and Pasummah on the western side of Sumatra. It consists of 23 substantive characters, formed of upright scratches or strokes, and on the whole it is more complete than either the Batak or Korinchi. See India; Kyans; Languages.

REJORE. BUOT. *Limnæus Nipalensis*.—*Hodgson*.

REK. HIND. of Kanawar, *Amygdalus persica*, the peach.

REKKALU. TEL. Feathers.

RELA CHETTU. TEL. *Cassia fistula* or *Cathartocarpus fistula*. *L.*

RELIC-RECEPTACLE. A Dehgopa.

RELIC WORSHIP. See Hindoo.

RELIGION. Of the religions of the S. and E. of Asia and philosophies which take their place, the demon and spirit and nature worship of the ruder races is perhaps the most ancient: the religion of the Jews, three thousand years old, may be the next, followed by the buddhist philosophy which seems to have been since 3,200 years, 850 years before Sakya Muni gave it fresh vigour, and is the most numerous of all. The philosophy put forth by Kung-fu-tse or Confucius about 700 years before Christ, has been added to and altered by subsequent sages of China. The Christian religion, first established in Western Asia nineteen centuries ago, and early taught in Africa, Arabia and Central and Eastern Asia, and at one

time largely followed, has, at present, in India, but a comparatively small number of professors. If India and South Eastern Asia be looked at in their religious aspects, three polytheist faiths will be seen, Buddhism, Brahminism, and Shamanism: three monotheistic faiths, Jewish, Christian and Mahomedan; a mixed faith the Sikh, partly monotheistic but believing in incarnations, and lastly the worship of fire as an element by the little numerous but intellectual Parsees. The followers of the various religions in the world, according to Hassel are, in millions,

Christians, ...	120	Brahmins,	111
Jews, nearly ...	4	Buddhists,	315
Mahomedans, ...	250		

The ancient history of India shows that it has had four great religious eras.—The Vedic, in which Agni, Indra and other personifications of spiritual existences were propitiated with feasts and invoked with the hymns of the Rig Veda, and in which maidens selected their husbands in the Swayamvara and monarchs sacrificed the horse in the Aswamedha. In the Brahminic period the Kshatriya feasts were converted into sacrifices for the atonement of sins against brahminical law, and divine worship was reduced to a system of austerities and meditations upon the Supreme Spirit as Brahma. It was in this era that the brahmins assumed the character of a great ecclesiastical hierarchy and established that priestly dominion which still extends over the minds and senses of the hindus of India. Thirdly, the Budd'hist period in which Sakya-muni appeared, and fourthly, the Brahminical revival during which brahmins abandoned the worship of their god Brahma, and reverted to the old national gods and heroes of the Vedic Aryans. In this era, Vishnu came to be regarded as the Supreme Being, and Rama and Krishna as his incarnations. Religion may be ethical, intellectual and affectional. The Chinese religion has never advanced beyond the latter, towards their parents.—*W. p. 56*.

RELIGIOUS FIG TREE. ENG. *Ficus religiosa*.—*Linn.*

RELIGIOUS MENDICANTS. See Gudara; Dhasre; Dewanagi-wanlu; Mendicants.

,, *pondicerianus, Gray* Pondicherry.
Gavialis gangeticus, Cuv. Ganges.

II. Water Lizards—Varanidæ.

Varanus flavescens, Gray. Ganges, Indus, Penang.
,, *dracæna, L.* ... From Bengal to Ceylon.
,, *lunatus, Gray* ...
,, *nebulosus, Gray* ... Bengal, Siam.
Hydrosaurus salvator, Laur. China, Siam (Ceylon.)

III. Land Lizards—Lacertidæ.

Tachydromus sexlineatus, Daud ... Rangoon.
,, *meridionalis, Gthr* ... Southern China.
,, *septentrionalis, Gthr* ... N. China.
Cabrita lechenaultii, Edw. Coromandel.
Ophiops jerdoni, Blyth ... Mhow.
Acanthodactylus cantoris, Gthr. ... Ramnuggar.
,, *nilgherrensis, Jerd.* ... Coonoor.

IV. Cordyles—Zonuridæ.

Pseudopterygialis, Gray ... Khasya.

V. Skinks—Scincidae.

- Tropidophorus microlepis*,
Gthr. ... Chartaboum.
,, *cochiiu-chinensis*, Cuv. Cochiiu-china.
,, *aspris berdmorei*, Bly. Mergui.
Euprepes chinensis, Gray. China.
,, *rufescens*, Shaw ... From Afghanistan to
China.
,, *monticola*, Gthr. ... Sikkim.
,, *olivaceus*, Gray ... Malayan Peninsula.
,, *macularius*, Blyth ... Rungpore?
,, *trilineatus*, Gray ... Carnatic.
Mabouia quadrilineata, Bly. Hongkong.
,, *chinensis*, Gray ... China.
,, *maculata*, Blyth ... Assam.
Eumeces bilineatus, Gr... Neilgherries.
,, *himalayanus*, Gthr. Himalayas.
,, *schlegelii*, Gthr. ... Sikkim.
,, *modestus*, Gthr. ... Ningpo.
,, *reevesii*, Gray ... China.
,, *ladacensis*, Gthr. ... Tibet.
,, *formosus*, Blyth ... Mirzapore, Wuzcerabad
,, *indicus*, Gray ... Sikkim.
,, *taprobaneus*, Kelaart. Ceylon.
Eumeces chalcides, L.... Penang, Siam, Hong-
kong.
,, *siamensis*, Gthr. ... Siam.
,, *bowringii*, Gthr. ... Hongkong.
,, *albopunctatus*, Gray ... Nellore, Mergui.
,, *hardwickii*, Gray ... Peninsula of India.
,, *punctatus*, E. ... Peninsula of India.
,, *isodactylus*, Gthr. ... Gamboja.
Hagria vosmaerii, Gray... Bengal.
Chiamela lineata, Gray...
,, *anguismelanosticta*,
Merr. ... Coromande.

VI. Acontiads—Acontiadidae.

- Acontias layardi*, Kelaart Colombo.
Nessia burtonii, Gray... Ceylon.
,, *monodactyla*, Gray Ceylon.

VII. Sand Lizards—Sepsidae.

- Sphenoccephalus tridacty-*
lus, Blyth ... Afghanistan.

VIII. Geckos—Geckotidae.

- Gecko guttatus*, Daud... From Southern India
to China.
,, *stentor*, Cant. ... Penang.
,, *smithii*, Gray. ... Prince of Wales' Island
,, *monarchus*, D. & B. Malayan Peninsula,
Ceylon.
,, *japonicus*, D. & B China, Chusan.
,, *swinhonis*, Gthr. ... Northern China.
,, *subpalmatus*, Gthr.. Chikiang.
Ptychozoon, homaloceph-
alum, Crevelt... Penang, Singapore.
Hemidactylus, triedrus,
Daud. ... Ceylon, Peninsula of
India.
,, *maculatus*, D. & B. From Ceylon to China.
,, *sykesii*, Gthr. ... Deccan.
,, *frenatus*, D. & B ... From Ceylon to Siam.
,, *leschenaultii*, D.
& B. Madras.
,, *punctatus*, Jerd ... Tellicherry.
,, *coctsi*, D. & B. ... Penang, Bombay, Cey-
lon.
,, *leiurus berdmorei*,
Blyth ... Mergui.
Peripia peronii, D. & B... Penang, Ceylon.
,, *captoris*, Gthr. ... Penang.

- Nycteridium schneideri*,
Shaw. ... Ceylon, Bengal, Assam,
Siam, Penang.
Phelsuma andamanense,
Blyth. ... Andaman Islands.
Gymnodactylus triedrus,
Gthr. ... Ceylon.
,, *pulohellus*, Gray ... Penang, Singapore.
,, *fræuatus*, Gthr. ... Ceylon.
,, *kandianus*, Kelaart. Ceylon.
,, *mysoriensis*, Jerdon Bangalore.
,, *indicus*, Gray ... Nilgherries.
,, (malabaricus Jerdon Malabar.
,, *littoralis*, Jerdon ... Malabar.
,, *deccanensis*, Gthr.. Deccan.
,, *variegatus*, Blyth... Moulmein.
,, *naulinus fasciola-*
tus, Blyth ... Subathoo.
Pentadactylus borneensis,
Gthr. ... Borneo.
,, *felinus*, Gthr. ... Singapore.
,, *duvanceli*, D. & B. Bengal.
Puellula rubida, Blyth ... Andaman Islands.
Eublepharis hardwickii,
Gray. ... Peninsula of India.

IX. Agames—Agamidae.

- Draco volans*, L. ... Penang, Singapore.
,, *reticulatus*, Gthr. ... Philippine Islands.
,, *timorensis*, Kuhl ... Timor.
,, *cornutus*, Gthr. ... Borneo.
,, *simbriatus*, Kuhl ... Java.
,, *maculatus*, Gray ... Siam, Penang, Tenas-
serim.
,, *spilopterus*, Wieg. ... Manilla.
,, *dussumieri*, D. & B... Peninsula of India.
,, *quinquefasciatus*, Gray. Penang.
,, *teniopterus*, Gthr ... Siam, Tenasserim.
,, *haematopogon*, Boie... Java
,, *bimaculatus*, Gthr. ... Philippine Islands
,, *lineatus*, Daud ... Amboyna, Celebes.
,, *rostratus*, Gthr ... Borneo?
Otocryptis bivittata, Wieg. Ceylon.
Lyriocephalus scutatus, L. Ceylon.
Ceratophora stoddartii,
Gray. ... Ceylon.
,, *tennentii*, Gthr ... Ceylon.
,, *aspera*, Gthr. ... Ceylon.
Cophotis ceylanica, Peters. Ceylon.
Japalura variegata, Gray. Sikkim.
,, *swinhonis*, Gr. ... Formosa.
,, *polygonata*, Hallowell. Loochoo.
Sitana poudiceriana, Cuv. Western India.
,, *minor*, Gthr. ... Madras, Ceylon.
Dilophyrus grandis, Gray. Rangoon.
Bronchocela cristatella,
Kuhl. ... Malayan Peninsula.
,, *smaragdina*, Gthr. Gamboja.
,, *jubata*, D. & B. ... Pondicherry.
Calotes versicolor, Daud... Ceylon, Continent of
India.
,, *nemoricola*, Jerd ... Neilgherries.
,, *mystaceus*, D. & B. Pegu, Siam, Mergui,
Ceylon.
,, *rouxii*, D. & B. ... Ceylon, Southern In-
dia.
,, *platyceps*, Blyth. ... Cherra Punji.
Calotes nigrilabris, Peters. Ceylon.
,, *emma*, Gray. ... Mergui.
,, *maria*, Gray. ... Himalayas.
Salea horaei, Gray ... Neilgherries, Ceylon.
Oriocalotes minor, Gray. Himalayas.
Acanthosaura armata, Gray. Eastern India.

- Acanthosaura capra*, *Gthr.* Chartabeum.
" coronata, *Gthr.* ... Chartabeum.
Oriolarius ellioti, *Gthr.* ... Sikim.
Tiaris tiara suboristata,
Blyth. ... Port Blair.
Physignathus cochinchinensis, *Cuv.* ... Cochin China.
" mentager, *Gthr.* ... Chartabeum.
Lioplepis guttatus, *Cuv.* ... Eastern India, China.
Uromastix hardwickii, *Gray.* Hindostan.
Charasia dorsalis, *Gray* ... Southern India.
Stellio tuberculatus, *Gray.* Upper Hindostan, Himalaya.
Trapelus megalonyx, *Gthr.* Afghanistan.
Phrynocephalus tickelii,
Gray. ... Afghanistan.
" caudivolvulus, *Pall.* ... Tibet.
" brachysaura ornata,
Blyth. ... Sagur.

FAMILY OF CHAMELEONS—CHAMELEONIDÆ.

- Chamaeleo vulgaris*, *Daud.* Peninsula of India, Ceylon.

THE ORDER OF SNAKES—OPHIDIA.

First Sub-order. Innocuous Snakes.

I. Blind Snakes—Typhlopidae.

- Typhlina lineata*, *Boie* ... Penang, Hongkong.
Typhlops nigrolabus, *D.*
& B. ... Penang, Singapore.
horsfieldii, *Gray.* Khasya, Assam, Tenasserim, Cochin-China.
Typhlops bothriorhynchus, *Gthr.* ... Penang.
" striolatus, *Peters.* Bengal.
siamensis, *Gthr.* ... Siam.
" braminus, *Daud.* All over the Continent, Ceylon.
" pammeces (tenuis)
Gthr. ... Madras.
" mirus, *Jan.* ... Ceylon.
Onychocephalus acutus, *D. & B.* Peninsula of India.

II. Short-tails—Tortricidae.

- Cylindrophis rufus*,
Laur ... Gamboja, Singapore, Tranquebar.
" maculatus, *L.* ... Ceylon.

III. Xenopeltides—Xenopeltidae.

- Xenopeltis unicolor*,
Reinw. ... Malayan Peninsula, Gamboja.

IV. Rough-tails—Uropeltidae.

- Rhinophis oxyrhynchus*, *Schneid* Ceylon.
" punctatus, *Mill.* Ceylon.
" philippinus, *Cuv.* Ceylon.
" trevelyanus, *Ke-*
laart ... Ceylon.
" sanguineus, *Bed-*
dome ... Wynad.
" blythii, *Kelaart.* Ceylon.
" pulneyensis, *Bed-*
dome ... Pulney Hills.
Uropeltis grandis, *Ke-*
laart ... Ceylon.
Silybura macrolepis,
Peters ... Peninsula of India.
" beddomii, *Gthr.* ... Peninsula of India.
" ocellata, *Beddome* Neilgherries.

- Silybura ellioti*, *Gray.* Madras, Deccan.
" bicatenata, *Gthr.* ... Deccan.
" shortii, *Beddome.* Shevaroy Hills.
" brevis, *Gthr.* ... Anamallay Hills, Neilgherries.
Plectrurus perrotetii, *D.*
& B. ... Madras, Neilgherries.
" guntheri, *Beddome* Neilgherries.
Melanophidium wynandense, *Beddome* Wynad.

V. Dwarf Snakes—Calamariidae.

- Calamaria siamensis*, *Gthr.* Siam, Cochin China.
" quadrimaculata, *D.*
and B. ... (Java.)
" albiventer, *Gray.* ... Penang.
" nigro-alba, *Gthr.* ... Penang.
Calamaria leucocephala,
D. and B. ...
" catenata, *Blyth* ... Assam.
" reticulata, *Blyth.* Assam.
Macrocalamus lateralis,
Gthr. ...
Oxycalomus longiceps,
Cantor. ... Penang.
Geophis microcephalus,
Gthr. ... Madras.
" (Platypteryx, per-
rotetii) *D. and B.* Neilgherries.
Aspidura brachyrorrhos,
Boie ... Ceylon.
" copii, *Gthr.* ...
" trachyprocta, *Cope.* Ceylon.
Haplocercus ceylonensis, *Gthr.* ... Ceylon.

VI. Oligodontes—Oligodontidae.

- Oligodon subgriseus*, ... Peninsula of India.
" spilonotus, *Gthr.* Madras.
" ellioti, *Gthr.* ... Madras.
" subpunctatus, *D.*
and B. ... Coast of Malabar.
" spinipunctatus, *Jan.*
fasciatus, *Gthr.* ... Deccan.
" sublineatus, ... Ceylon.
" affinis, *Gthr.* ... Anamallay Hills.
" templetanii, *Gthr* Ceylon.
" modestus, *Gthr.*
" dorsalis, *Gray* ... Afghanistan?
" brevicauda, *Gthr* Anamallay Hills,
Simotes venustus, *Jer-*
don ... Peninsula of India,
" russellii, *Daud.* ... Ceylon, Peninsula of India, Himalayas.
" binotatus, *D. & B.* Peninsula of India.
" albiventer, *Gthr.* Ceylon.
" signatus, *Gthr.* ... Singapore.
" cinereus, ... Gamboja.
" swinhonis, ... Amoy.
" taniatus, ... Gamboja, Bangkok.
" trilineatus, *D & B.*
" punctulatus, *Gray* Himalayas.
" labuanensis, *Gthr.* Borneo.
" bicatenatus, ...
" albocinctus, *Cant-*
or ... Assam.
" fasciolatus, *Gthr.* Pachebone.
" cochinchinensis,
Gthr. ... Lao Mountains.
" trinotatus, *D. & B.* Penang, China.

VII. Colubridæ.—Colubridæ.

- Ablabes baliodirus*, *Boie.* Penang.

Ablabes tenuiceps, *Blyth* ... Nepal, Darjeeling.
 " *fuscus*, *Blyth* ... Himalayas.
 " *rappii*, *Gthr.* ... Himalayas.
 " *bicolor*, *Blyth* ... Khasya.
 " *olivacea*, *Bed-*
 dome ... Neilgherries.
 " *sagittarius*, *Can-*
 tor ... Penang, Bengal, Hima-
 layas.
 " *humberti*, *Jan* ... Madras, Ceylon.
 " *collaris*, *Gray* ... Khasya, Nepal.
 " *melanocephalus*,
 Gray ... Malacca.
Cyclophis major, *Gthr.* ... China.
 " *frænatus*, *Gthr.* ... Afghanistan.
 " *calamaria*, " ... Ceylon, Peninsula of
 India.
 " *nasalis*, *Gthr.* ...
 " *monticola*, *Cantor.* ... Assam.
Odontomus nympha,
 Daud ... Vellore.
 " *semifasciatus*,
 Gthr. ...
 " *gracilis*, *Gthr.* ... Madras Presidency.
Nymphophidium ma-
culatum, *Gthr.* ...
Elaeistodon wester-
manni, *Reinw.* ...
Coronella orientalis, *Gthr.*
Coluber rufodorsatus,
 Cantor ... China.
 " *mandarinus*, *Can-*
 tor ... Chusan.
 " *porphyraeus*,
 Cantor ... Khasya, Assam.
Elaphis diene, *Pall* ... Northern China.
 " *sauromates*, *Pall.*
 Ningpo.
 " *tanjurus*, *Cope* ... China, Siam.
Compsosoma radiatum,
 Reinw. ... Eastern India.
 melanurum, *Schleg* ... Bengal, China.
 " *reticulare*, *Cantor* ... Himalayas, Assam.
 " *hodgsonii*, *Gthr.* ... Himalayas.
Cynophis helena, *Daud*
 Peninsula of India.
 " *malabaricus*, *Jer-*
 don ...
Ptyas mucosus, *L.* ... All over the Continent,
 Ceylon.
 " *korros*, *Reinw.* ... Eastern India.
Xenelaphis hexahonotus,
 Cantor ... Arakan, Penang, Singa-
 pore.
Zamenis diadema, *Schleg.* ... Afghanistan, Sindh.
 " *ventrimaculatus*
 Gray ... Western India.
 " *gracilis*, *Gthr.* ... Deccan, Sindh.
 " *fasciolatus*, *Shaw* ... Peninsula of India, Ben-
 gal, Province Wellesley.
Zoys fuscus, *Gthr.* ... Borneo.
 " *carinatus*, *Gthr.* ...
 " *dumnades*, *Can-*
 tor ... Chusan, Ningpo.
 " *nigromarginatus*,
 Blyth ... Himalayas.
Herpetorhas sieboldii,
 Gthr. ... Sikkim.
Tropidonotus quincun-
ciatus, *Schleg* ... All over India.
 " *annularis*, *Holle-*
 well ... China.
 " *trianguligerus*,
 Reinw. ... Penang.
 " *macrophthalmus*,
 Gthr. ... Himalayas.

Tropidonotus dorsalis, *Gthr* ... Chikiang.
 " *macrops*, *Blyth* ... Darjiling.
 " *platyceps*, *Blyth* ... Himalayas.
 " *subminiatus*, *Reinw.* ... Eastern India.
 " *himalayanus*, *Gthr* ... Himalayas.
 " *angusticeps*, *Blyth* ... Assam, Arakan.
 " *stolatus*, *L.* ... All over the Indian Con-
 tinent.
 " *monticola*, *Jerdon* ... Anamalai Hills.
 " *junceus*, *Cantor.* ... Penang, Chikiang.
 " *ceylonensis*, *Gthr.* ... Ceylon.
 " *beddomii*, *Gthr.* ... Neilgherries.
 " *nigrocinctus*, *Blyth* ... Pegu ? Tenasserim.
 " *flavipunctatus*, *Hal-*
 low ... Hongkong.
 " *zebrinus*, *Blyth* ... Mergui.
 " *tigrinus*, *Boie* ... Northern China.
 " *leucomelas*, *Gthr.* ... Penang.
 " *plumbicolor*, *Cantor.* ... Madras Presidency.
Atretium schistosum, *Daud.* ... From Ceylon to the Ma-
 layan Peninsula.
Xenochrophis ceraso-
gaster, *Cantor.* ... Malayan Peninsula, Ben-
 gal, Assam, Khasya.
Prymnodion chalcus,
 Cope ... Siam.

VIII—Fresh-water Snakes—Homalopsidæ.

Fordonia unicolor, *Gray* ... Penang.
Cantorio elongata, *Gthr.* ... Singapore.
Cerberus rhynchops,
 Schneid ... From Ceylon to Siam.
Hypsirhina plumbea, *Boie.* ... Eastern India.
 enhydria, *Schneid.* ... Bengal, Eastern India.
 " *jagorii*, *Peters* ... Siam.
 " *bennettii*, *Gray* ... China.
 " *chineseis*, *Gray* ... China.
Ferania sieboldii, *Schleg.* ... Bengal Province Welles-
 ley.
Homalopsis buccata, *L.* ... Malayan Peninsula,
 Gamboja.
Hipiates hydrinus, *Cant.* ... Penang.
Herpeton tentaculatum,
 Lacep ... Siam.

IX. Desert Snakes—Psammophidæ.

Psammophis condanarus,
 Merr. ... Peninsula of India.
Psammodynastes pulver-
ulentus, *Boie* ... Eastern India.

X. Tree Snakes—Dendrophidæ.

Gonyosoma oxycephalum, *Boie.* ... Penang, Tenasserim.
 " *gramineum*, *Gthr.* ... Khasya.
 " *frænatum*, *Gray* ... Khasya.
Phyllorhis carinata, *Gthr.* ... China.
Dendrophis picta, *Gm.* ... All over India.
 " *caudolineata*, *Gray* ... Penang, Singapore.
Chrysopela ornata, *Shaw.* ... All over India.
 " *rubescens*, *Gray* ...

XI. Whip-Snakes—Dryiophidæ.

Tropidococcyx perroteti, *D. & B.* ... North Canara.
Tragops prasinus, *Reinw.* ... Eastern India.
 " *dispar*, *Gthr* ... Anamalai Mountains.
 " *fronticinctus*, *Gthr.*
Passerita mycterizans, *L.* ... Ceylon, Peninsula of
 India
 " *purpurascens*, *Gthr.* ... Ceylon.

XII. Dipnades—Dipnadiidæ.

Dipsas cynodon, *Cuv* ... Malayan Peninsula.

- Dipsos, foresti*, D. & B. Anamallay Mountains
 " *boops*, Gthr. Bengal.
 " *dendrophila Reinw.* Malayan Peninsula.
 " *bubalina, Klein* Assam, China?
 " *multimaculata, Schleg.* Bengal, Eastern India.
 " *trigonata, Schneid.* Peninsula of India,
 gal.
 " *multifasciata, Blyth.* Subathoo.
 " *gokool, Gray.* P'ouang, Bengal.
 " *ceylonensis, Gthr.* Ceylon.

XIII. Lycodontes—Lycodontidae.

- Lycodo sulicus, L* Ceylon and Continent
 of India.
 " *laeensis, Gthr.* ... Cochin-China.
 " *striatus, Shaw* ... Peninsula of India.
 " *anamallensis, Gthr.* Anamallay Mountains.
 " *rufozonatus, Cant.* Chusan.
Tetragonosoma effrene, Cant. Penang.
 " *atropurpureum, Cant.* Mergui.
Leptorhiza jara, Shaw. Peninsula of India,
 Bengal, Assam.
Ophites subcinctus, Boie. Penang.
 " *albofuscus, D. & B.* Coast of Malabar.
Cercaspis carinata, Kuhl. Ceylon.

XIV. Blunt-Heads—Amblycephalidae.

- Amblycephalus boa Kuhl.* Penang.
Paraes carinata, Reinw. ... Cochin-China.
 " *monticola, Cant.* ... Assam.
 " *lovis, Kuhl* ... Cochin-China, Khasya.

XV. Rook Snakes—Pythonidae.

- Python reticulatus, Schneid.* Malayan Peninsula.
 " *molurus, L* ... Peninsula of India,
 Bengal, Nepal.

XVI. Sand Snakes—Erycidae.

- Gongylophis conicus, Schneid.* Peninsula of India,
 Sikkim.
Cursoria elegans, Gray Afghanistan.
Eryx johnii, Russell. Peninsula of India,
 Punjab, Sikkim.

XVII. Wart Snakes—Acrochordidae.

- Acrochordus javanicus, Hornst.* ... Penang, Singapore.
Chersydrus granulatus, Schneid. ... Eastern coasts of
 Southern India, Ma-
 layan Peninsula.

Second Sub-order. Venemous Colubrine Snakes.

I. Terrestrial—Elapidae.

- Naja tripudians, Merr.* Over nearly entire India.
Ophiophagus elaps, Schleg. ... Over nearly entire India.
Dungarus caeruleus, Schneid. ... Peninsula of India, Ben-
 gal, Assam.
 " *fasciatus, Schneid* Continent of India.
 " *ceylonicus, Gthr.* Ceylon.
 " *semifasciatus, Kuhl.* ... China, Formosa.
Xenurelaps bungaroides, Cantor ... Assam.
Megarophis flaviceps, Reinw. ... Penang.
Gallophis bivirgatus, Boie. ... Malayan Peninsula.
 " *intestinalis, Laur.* Malayan Peninsula.
 " *gracilis, Gray* ... Penang and Singapore.

- Gallophis maculallandii, Reinw.* ... Himalayas, Nepal, Assam.
 " *annularis, Gthr.* ...
 " *trimaoulatus Daud.* Tenasserim, Bengal.
 " *maculiceps, Gthr.* Malayan Peninsula.
 " *nigrescens, Gthr.* Neilgherries.

II. Sea Snakes—Hydrophidae.

- Platurus scutatus, Laur.* Indian Ocean, Pacific.
 " *fischeri, Jan* ... Indian Ocean.
Aipysurus anguillae-
formis, Schmidt. Australia Seas.
 " *lovis, Lacép.* ... Northern Australia.
 " *fuscus, Tschudi.* Australia.
Disteria dolata, Lacép.
Acalyptus superciliosus
D. & B. ... South Western Pacific.
Hydrophis Jerdonii, Gray. ... Madras, Penang.
 " *Stokesii, Gray.* ... Northern Australia.
 " *major, Shaw.* ... Indian Ocean.
 " *robusta, Gth.* ... Indian Ocean.
 " *belcheri, Gray.* ... New Guinea.
 " *caeruleus, Shaw.* Indian Ocean.
 " *aspera, Gray.* ... Singapore.
 " *spiralis, Shaw* ... Indian Ocean.
 " *cyanocincta, Daud.* Indian Ocean.
 " *melanosoma, Gthr.*
 " *subcincta, Gray.* Indian Ocean.
 " *nigrocincta, Daud.* Bengal.
 " *elegans, Gray* ... Australia.
 " *torquata, Gthr* ... Penang.
 " *chloris, Daud* ... Madras, Bengal, Penang.
 " *lindsayi, Gray* ... China, Siam, Malabar.
 " *atriceps, Gthr.* ... Siam.
 " *latifasciata, Gthr.* Mergui.
 " *coronata, Gthr.* Bengal.
 " *diadema, Gthr.* ...
 " *gracilis, Shaw.* ... Madras, Java.
 " *fasciata, Schneid.* ... Vizagapatam.
 " *cantoris, Gthr.* ... Penang.
 " *lapemoides, Gray.* Ceylon, Madras.
 " *longiceps, Gthr* ... Indian Ocean.
 " *stricticollis, Gthr.* Indian Ocean.
 " *ornata, Gray* ... Indian Ocean.
 " *elliott, Gthr* ... Siam, Madras, Ceylon.
 " *pachycercus, Fisch.* East Indian Archipelago.
 " *viperina, Schmidt.* Madras, Java.
 " *ocellata, Gray.* Australia.
 " *anomala, Schmidt.* Samarang.
 " *curta, Shaw* ... Madras.
 " *hardwickii, Gray.* Penang.
 " *lorea, Gray* ... Borneo, Philippines.
Enhydrina, bengalensis, Gray ... Indian Ocean.
Pelamis bicolor, Schneid ... Indian & Pacific Ocean.
 Third Sub-order. Viperine Snakes.
 I. Pit-vipers—Crotalidae.
Trimeresurus gramineus, Shaw ... Eastern parts of the
 continent.
 " *erythrurus, Cant.* China, Bengal, Siam,
 Java.
 " *carinatus, Gray* Sikkim, Bengal, Rau-
 goon.
 " *purpureus, Gray.* Penang, Singapore.
 " *anamallensis, Gthr.* Anamallay Hills.
 " *monticola, Gthr* ... Nepal, Sikkim.
 " *wagleri, Schleg* ... Malayan Peninsula.
Trimeresurus strigatus, Gray ... Nilgherries, Deccan.
 " *trigonocephalus, Merr.* ... Ceylon.

<i>Trimeresurus macrolepis</i> , <i>Oant.</i>	Assam.
<i>Pelteporus macrolepis</i> , <i>Beddome</i>	Anamallay Hills.
<i>Calotes laticauda</i> , <i>Reuv.</i>	Siam.
<i>Hyla blomhoffii</i> , <i>Boie</i>	Japan, Formosa.
" <i>pallasi</i> , <i>Gthr.</i>	Tartary.
" <i>himalayanus</i> , <i>Gthr.</i>	Tibet.
" <i>elliotti</i> , <i>Jerd.</i>	Nilgherries.
<i>Hymenocorys nepes</i> , <i>Laur</i>	Ceylon, Southern India.

II. Vipers—Viperidae.

<i>Daboia russellii</i> , <i>Shaw</i>	Ceylon, Southern India, Himalayas.
<i>Echis carinata</i> , <i>Schneid.</i>	Southern India.

SECOND SUB-CLASS, BATRACHIANS.

The Order of Tailless Batrachians—*Batrachia Salientia*.

<i>Oxyglossus lins</i> , <i>Tschudi</i>	Siam, Gamboja, China.
<i>Dicoglossus adolfi</i> , <i>Gthr.</i>	Himalayas.
<i>Rana kuhlii</i> , <i>Schleg</i>	Ceylon, Ningpo.
" <i>hexadactyla</i> , <i>Less</i>	Ceylon, Madras.
" <i>cyanophlyctis</i> , <i>Schneid.</i>	Ceylon, Southern India, Lower Bengal.
" <i>tigrina</i> , <i>Daud.</i>	Sikkim, Nepal.
" <i>liebigii</i> , <i>Gthr.</i>	All over India.
" <i>esculenta</i> , <i>L.</i>	China.
" <i>silvatica</i> , <i>Leconte</i>	Ningpo.
" <i>gracilis</i> , <i>Wieg.</i>	From Madras to Southern China.

The Reptiles are oviparous or ovoviviparous vertebrate animals with red, cold blood, with three cavities of the heart, breathing by lung either during the whole period or, at least, in the later stages of their growth. They are naked; but frequently the skin shows scale-like folds, or is tubercular, or forms osseous scutes.

The First Sub-class or Reptilia Proper have only one ventricle of the heart, incompletely divided; two atria. Never possessing branchia at any period of life. One occipital condyle. Skin with scale-like folds, or tubercular, or forming osseous scutes. This sub-class comprises the Order of Tortoises (Chelonina) that of the Lizards (Sauria) and that of the snakes (Ophidia).

The order of Tortoises, or Chelonina are Reptiles with the bones of the thorax united into a carapace.

The Land Tortoises—Testudinidae. Only one genus is found in British India.

Testudo Elegans, or Starred Tortoise.

Testudo elegans *Schoeff.* p. 111, tab. 21 Young.

Testudo stellata, *Schweig Prodr.* sp. 13.
Testudo actinodes, *Bell, Zool. Journ.* iii. p. 419 iv. tab. suppl. 23 (24) and *Testud. Pl.* (gibbon variety.)

—*stellata*, *Gray's Synops. Rept.* p. 12, tab. 8 (middle age).

—*geometrica*, *Hutton, Journ. As. Soc. Beng.* vi. 1837, p. 689, pl. 38 (adult male).

—*megalopus*, *Blyth, Journ. As. Soc. Beng.* xxii. 1858, p. 640 is, according to an oral communication by Mr. Blyth, identical with *T. elegans*.

This species is not very scarce, and is probably found in many parts of the Peninsula of Southern India. Well authenticated localities are Madras, Coromandel, the low jungles of the Carnatic, Pondicherry, and Ceylon. *As*

according to Mr. Blyth, it does not inhabit Lower Bengal, and is rarely brought alive to Calcutta. The shell attains to a length of 12 inches, larger specimens being very scarce.

Testudo Horsfieldii. Gray. Afghan Tortoise. *Homopus burnesii*, Blyth, *Journ. As. Soc. Beng.*, xxii. 1854, p. 642.

Found in Afghanistan, extends to Nepal, resembles *T. græca*, the habits of both probably being alike.

Testudo elongata. Blyth, *Journ. As. Soc. Beng.* xxii. 1853, p. 639. Gray, *Proc. Zool. Soc.* 1856, p. 181, pl. 9, *Ann. & Mag. Nat. Hist.* 1861, vi. p. 218.

The Burmese Tortoise, 13 in. long, of Arakan, Burmah, Tenasserim, Gamboja.

SECOND FAMILY.

The Fresh-water Tortoises—*Emydidæ*.

Shell sometimes convex, generally more or less depressed. Toes distinct, webbed; feet for walking and swimming; claws 5 (4)—4. Shell with horny shields; caudal shields separate.

Manouria emys. The Brown Tortoise.

Testudo emys, Müll and Schleg. *Verhand. Nat. Geschied. Rept.* p. 34, tab. 4.

Manouria fusca, Gray, *Proc. Zool. Soc.* 1852, p. 138, and *Shield, Rept.* p. 16, tab. 3 and *Proc. Zool. Soc.* 1860, p. 395, *Rept.* p. 31.

Testudo phayrei, Blyth, *Journ. As. Soc. Beng.* xxii. 1853, p. 639.

Teleopus luxatus, Leconte, *Proc. Acad. Nat. Sc. Philad.* 1854, p. 187.

This species grows to a rather large size, the shell of a specimen in the British Museum being $19\frac{1}{2}$ inches long, 14 inches broad, and 7 $\frac{1}{2}$ inches deep. It is found at Penang, in Arakan and the Tenasserim Provinces in Java, Sumatra and the Murray river in Australia.

Cuora amboinensis. Gray. Baniog or Cuoro.

Testudo amboinensis, Daud, *Rept.* ii. p. 309.

Cistudo amboinensis. Gray. *III. Ind. Zool. tab.*

Dum and Bibr. Erpet. gen. ii. p. 215, pl. 15, fig 2.

Terrapeus bicolor, Bell, *Zool. Journ.* ii. p. 484, tab. 16.

This species attains to a length of 8 inches; it is found in nearly all the tropical parts of India, at least near the coasts of Penang, Singapore, the Tenasserim Provinces, Gamboja, Sumatra, Java, Amboyna, Gilolo, and the Philippine Islands. The Malays of the Peninsula call it Baniog. It is more terrestrial in its habits than aquatic.

Cuora flavomarginata. Black-bellied Box Tortoise.

Cystoclemys flavomarginata. Gray,

Its shell attains to a length of $7\frac{1}{2}$ inches.

Cuora trifasciata. Chinese Box Tortoise.

Cistudo trifasciata, Gray, *Syn. Rept.* p. 19. *Illustr. Ind. Zool. tab.*

Sternotherus trifasciatus, Bell, *Zool. Journ.*, ii. p. 299, tab. 13.

Seems restricted to China; shell 7 in. long.

Cyclemys oldhami, Gray, from Mergui and Gamboja; 8 inches long. The Lao mountains in Cochinchina; shell 3 to 7 in. long does not alter much with age.

Pyxidea mouhotii, Gray, MS.

Cyclemys mouhotii, Gray in *Ann. and Mag. Nat. Hist.* 1862, x. p. 157.

The Lao Mountains in Cochinchina; shell 3 to 7 in. long; does not alter much with age.

Notochelys platynota. Gray, MS. Flat-backed Emys.

Emys platynota, Gray, *Proc. Zool. Soc.* 1834, p. 54; *Illustr. Ind. Zool. tab.*

Shell 10 inches long. Singapore.

Geomyda spinosa. Gray. The Spinous Tortoise.

Emys spinosa, Gray, *Illustr. Ind. Zool. Bell, Testud. tab.* (young).

Malay Peninsula, Penang, Singapore and Sumatra; habits aquatic, the hind toes webbed.

Geomyda grandis. Gray. *Ann. & Mag. Nat. Hist.* 1861, VI. p. 218.

Emys siamensis (Gray MS.) *Guth. Proc. Zool. Soc.* 1860, p. 218.

Gamboja, 17 to 18 inches long.

Emys.

Pond Tortoises. *Terrapens*.

The species of this genus inhabit all the temperate and tropical regions, except Australia. Formerly (between the latest geological and the historical periods) the genus had even a still greater geographical range than now, a species in a semi-fossil state being found in England and in other European countries, where it is extinct at present. The species undergo great changes in external appearance with age, and it is almost impossible to make out the whole history of the development of a species from the isolated example preserved in European collections; on the other hand, naturalists residing between the tropics frequently apply names to species for which they were never intended, thereby rendering their observations on the habits, development, and geographical range useless, or productive of numerous errors. The *Terrapens* abound in still waters and tanks in the southern parts of India; perfectly motionless, they rest on the water, with the shell and the snout raised above its surface, suddenly disappearing at the approach of danger, and darting away with the swiftness of a fish. Their pointed claws enable them to crawl easily over slippery and steep places, and to dig little holes for a small number of elongate ovate, hard shelled eggs, which in some species require as long a period as from eighteen to twenty months before they are hatched. They are chiefly carnivorous, and the flatter the shell, the broader the interdigital web, the

more denticulated the jaws, the more aquatic and carnivorous are the habits of the Pond Tortoises. The food of the carnivorous species consists of water insects, frogs, small fishes, small aquatic birds and mammals; whilst on the other hand they are persecuted by alligators and large fishes, and the young and eggs by numerous other animals. They are not used as food by man, the flesh of most species having a very disagreeable smell, which is also perceptible when first taken out of the water in a net or by a hook baited with meat. Pegu, Sitang, Schwe Gyu, Tenasserim, $7\frac{1}{2}$ inches long.

Emys ocellata. Ocellated Pond Tortoise.

Emys ocellata, *Dum. & Bibr. Erpet. gen. ii. p. 329*, pl. 15, fig. 1 (not good). *Blyth, in Journ. As. Soc. Beng. xxi. 1854*, p. 645 & xxiv. p. 481.

Batagurocellata, *Gray, Shield, Rept. p. 36*; *Proc. Zool. Soc. 1856*, p. 182. pl. 10 & 10 a.

Emys berdmorei, *Blyth, l. c. 1859*, p. 231.

Emys bealii. The Speckled Pond Tortoise.

Cistudo (?) bealii, *Gray, Syn. Rept. p. 71*.

Emys bealii, *Gray, Shield, Rept. p. 21. tab. 8*.

Southern China; $5\frac{1}{2}$ inches long.

Emys thurgii. The Thurgi. *Gray, Syn. pp. 22 & 72*, and *Shield, Rept. p. 21. Dum. & Bibr. Erpet. gen. ii. p. 318*.

Testudo thurgii, *Gray, Illustr. Ind. Zool.*

Emys flavo-nigra, *Less. Bull. Sc. xxv. p. 12*, and in *Belanger, Voy. Ind. Orient., Rept. p. 22*.

Found in the Ganges, probably in the whole of Bengal also according to Cantor in Penang.

Emys mutica. The Chusan Terrapen.

Emys muticus, *Cantor, Ann. & Mag. Nat. Hist. 1842*, ix. p. 482.

Chusan.

Emys nigricans. *Gray, Proc. Zool. Soc. 1834*, p. 53, and *Shield, Rept. p. 20. tab. 6*. The Blackish Pond Tortoise. A native of China.

Emys sinensis. The Chinese Pond Tortoise.

Emys sinensis, *Gray, Proc. Zool. Soc. 1834*, p. 53, and *Shield, Rept. p. 21. tab. 7*. (half-grown).

Emys bennettii, *Gray, Shield, Rept. p. 22. tab. 10*.

Neighbourhood of Canton, is Formosa land.

Emys crassicolis. Thick-necked Pond Tortoise.

Emys crassicolis, *Gray, Syn. p. 21. tab. 7. fig. 3*; *Illustr. Ind. Zool. tab. fig. 2*; *Shield, Rept. p. 20. Cantor, Mal. Rept. p. 3*.

Emys nigra, *Blyth, Journ. As. Soc. Beng. xxiv. 1855*, p. 713.

7 in. long, feeds on frogs, shell fish, and animal offal. Found at Mergui and the Malayan Peninsula. Specimens of this species, or of one closely allied to it, have been brought from Gamboja, Sumatra and Java, the costal ridges of these specimens are very indistinct, and the postgular plates comparatively larger.

Emys reevesii. Reeves's Pond Tortoise.

Emys reevesii, *Gray, Syn. Rept. p. 73. Dum. & Bibr. Erpet. gen. ii. p. 313*.

Geoclemys reevesii, *Gray, Shield, Rept. p. 19. pl. 5*.

From 3 to 4 inches long, is a native of southern China and Cochin-China.

Emys trijuga. Ceylonese Pond Tortoise.

Emys trijuga, *Schweigg. Prodr. p. 31. Dum. & Bibr. Erpet. gen. ii. p. 310. Gray, Shield, Rept. p. 20. tab. 4*, and *tab. 37. fig. 2. Kelaart, Prodr. Faun. Ceylon, p. 177*.

Emys sebæ, *Gray, Syn. Rept. p. 75*.

Emys thermalis, *Reynaud, in Less. Cent. Zool. p. 89. pl. 29 (test Gray)*.

—*belangeri*, *Less. in belang. Voy. Ind. Orient., Rept. p. 291. pl. 1* (not good).

Geoclemys sebæ, *Gray, Shield, Rept. pp. 18 & 77*.

Thoroughly aquatic and carnivorous, rather common in the peninsula of India and Ceylon.

Emys macrocephala. Broad-headed Terrapen.

Geoclemys macrocephala, *Gray, Proc. Zool. Soc. 1859*, p. 478. pl. 21, and 1861, p. 139.

Siam, Gamboja.

Emys hamiltonii. Yellow-spotted Emys.

Emys guttata, *Gray, Illustr. Ind. Zool. tab.*

—*hamiltonii*, *Gray, Syn. Rept. pp. 21, 72*.

—*piequotii*, *Less. in Belang. Voy. Ind. Orient., Zool. Rept. p. 294*.

Geoclemys hamiltonii, *Gray, Shield, Rept. p. 17*.

The shell of this elegant tortoise is oblong-ovate, with three longitudinal ridges, each plate of the vertebral and costal series being elevated into a nodose prominence. It is common in the lower Ganges and its vicinity. From 2 to $5\frac{1}{2}$ inches long. It feeds on animal substances—in captivity on raw meat.

Pangshura, *Gray*. Thorax and sternum solid, entirely bony, united into an immoveable carapace; the upper shell is angularly elevated, compressed; the fourth and, generally, the third vertebral plates are pointed at their junction. Sternum flat in both sexes; pectoral plates sub quadrangular, forming a suture together; caudal divided into two. Feet with the toes broadly webbed. Claws of moderate size, five anteriorly and four posteriorly. This genus is confined to the Indian Continent, and in habits resemble the Emysides proper.

Pangshura tecta. The Pangshure.

Emys tecta, *Gray, Syn. Rept. p. 23. tab. 25*; *Illustr. Ind. Zool. c. fig. Bell, Testud. c. tab.*

E. trigibbosa, *Less. in Belang. Voy. Ind. Orient., Rept. p. 29*.

Batagur tecta, *Gray, Shield, Rept. p. 36*.

Common in the Ganges and other rivers of Bengal, may be easily distinguished by its elevated back, by the form of the first vertebral shield, and by the coloration of the sternum. The first vertebral is pentagonal, the hinder side being the shortest. The lower parts of the shell yellow, with large blackish-brown spots. Shell 5 to 6 inches long.

Pangshura tentoria. The Dura.

Emys tectum (adult), *Gray, Illustr. Ind. Zool. figs. 3-5*.

E. tentoria, *Gray, Proc. Zool. Soc. 1834*, p. 54.

Batagur tentoria, *Gray, Shield, Rept. p. 37*.

The Dura is very similar to the Pangshure,

from which it may be readily distinguished by its somewhat more depressed shell, its greatest depth being less than one-half of its length. The upper shell is uniform brown; the sternal plates blackish brown with yellow margins. The Deccan, the Indus, the banks of the Kistna and its tributaries, where it is called by the natives Gunaugi mek'ham.

Pangshura flaviventer is easily distinguished from the two preceding by its bell-shaped first vertebral plate and by its uniform yellowish sternum. It resembles much in form the *P. tecta*, but is rather more elevated, having a large impression in the middle of the second and third costal plates. The first vertebral shield is bell-shaped, longer than broad, and broadest behind.

Pangshura smithii.

Batagur smithii, Gray, MS.

The upper shell is yellowish, with a part of the vertebral keel blackish. The lower parts are blackish, each plate with yellowish margin.

Batagur, Gray. Thorax and sternum solid, entirely, or nearly entirely, bony in full-grown specimens, united into an immovable carapace; shell depressed. Sternum flat in both sexes; pectoral plates subquadrangular, forming a suture together, broadly webbed toes, claws feeble. This genus is confined to the East Indies; its species grow to a considerably larger size than the *Emydes* proper, but have the same habits.

Batagur baska. The *Batagur*.

Emys batagur, Gray, Syn. Rept. p. 23, and Illustr. Ind. Zool. tab.

—*baska*, Gray, Illustr. Ind. Zool. tab.

Trionyx ouviei, Gray, Syn. Rept. p. 50 (very young?).

Tetraonyx longicollis, Less. in Belang. Voy. Ind. Orient., Rept. p. 297.

—*baska*, Dum. & Bibr. Erpet. gen. ii. p. 341.

—*lessonii*, Dum. & Bibr. Erpet. gen. ii. p. 338. pl. 16. fig. 1. Blyth, Journ. As. Soc. Beng. xii. 1854, p. 645.

Batagur baska, Gray, Shield, Rept. p. 35, tab. 16, and tab. 36, fig. 1 (skull).

Tetraonyx affinis (part.), Cantor, Catal. Mal. Rept. p. 6.

Head covered with undivided skin; snout rather pointed, nose turned upwards; upper jaw denticulated. Tail rather shorter than the head. Colour uniform brown in preserved specimens, shell 20 inches long: it is thoroughly aquatic in its habits; is found in the Ganges and Irrawaddy, abounds at the mouth of the Hoogly, great numbers are brought to Calcutta, where they are eaten by particular castes and are even kept for sale in tanks. Dr. Cantor caught one in the sea off Penang, with a small hook baited with a shrimp.

Batagur lineatus. The *Kachuga*.

Emys lineata, Gray, Syn. Rept. p. 23.

Emys kachuga, Gray, Illustr. Ind. Zool. tab. *Batagur lineata*, Gray, Shield, Rept. p. 35. tab. 17 (young).

An interrupted keel along the middle of the vertebrae, disappearing in old specimens. Uniform brown above and yellowish below.

Batagur elliptici. Gray. Proc. Zool. Soc. 1862, p. 264.

Penku Tambel. Obtained in the Kistna river. Uniform brownish above, yellowish below. Feet during life dotted with brown.

Batagur affinis.

? *Emys trivittata*, Dum. & Bibr. Erpet. gen. ii. p. 331. Cantor, Mal. Rept. p. 4.

Tetraonyx affinis (part.), Cantor, l. c. p. 6.

The shell of the adult 18 inches long by 13 inches broad. Nuchal plate none; the first second vertebrae broader than long. Head covered with undivided skin. Jaws not denticulated, the upper with a slight notch anteriorly. Tail shorter than the head. Feet strongly webbed; front part of the fore leg with imbricate, narrow, transverse scutes; claws feeble. Rivers and ponds of the Malay an Peninsula and of Penang, but not numerous.

Batagur dhongoka. The *Dhongoka*.

Emys dhongoka, Gray, Illustr. Ind. Zool. ii. tab. —*duvaucellii*, Dum. & Bibr. Erpet. gen. ii. p. 334.

Batagur dhongoka, Gray, Shield Rept. p. 36. tab. 18. (young), & tab. 36. fig. 1 (skull).

Very similar to the *B. lineatus*, but may be easily distinguished by a vertebral ridge and an interrupted stripe on each side of it black. A yellow line runs from the nostril to the upper part of the tympanum. The Ganges at Sultanpore, Lahore, Nepal, and Assam. The shell 15 inches long and is entirely ossified.

Platysternum, Gray. Shell entirely bony, comparatively small, much depressed; sternocostal suture covered with a series of three plates. Head very large, covered with a thick, hard, horny case; jaws strong. Tail very long, covered with rings of subquadrangular shields. Head, tail, and limbs not capable of being retracted within the shell. Toes moderately webbed; claws strong five anteriorly and four posteriorly.

Platysternum megacephalum, Muller.

Platysternon megacephalum, Gray, Proc. Zool. Soc. 1831, p. 106; Illustr. Ind. Zool. c. tab. Dum. & Bibr. Erpet. Gen. ii. p. 345. tab. 16. fig. 6.

A native of China, probably of the southern parts, and extends southwards into Pegu, at Schwe Gyeen, on the Sitang river. 14 inches long, shell 5 inches in length.

THIRD FAMILY.

Trionycidae. The Freshwater Turtles.

Shell much depressed, covered with soft skin. Feet for swimming; toes distinct, strongly webbed; claws 3—3.

Emyda, Gray. Shell oval, depressed, only partly ossified, covered with soft skin, a more or less broad margin remaining cartilaginous. Sternum more or less cartilaginous, the ossifications proceeding from seven centres; a broad flexible flap (valve) on each side of the posterior sternal lobe. Feet broadly webbed, with three strong claws anteriorly and posteriorly. Tail none. The East Indies, Senegambia; habits thoroughly aquatic and carnivorous; do not attain to a large size; eggs spherical. When the water dries up, they bury themselves deep in the mud.

Emyda granosa. The Bungoma.

La Chagrinee, Lapep. *Quadr. Ovip.* i. p. 171.

Testudo granosa, Schoepff, *Testud.* p. 127. tab. 30. A. B.

Emyda punctata, Gray, *Syn. Rept.* p. 50.

Trionyx punctata, Gray, *Illustr. Ind. Zool.*

—*granosus*, Gray, *Illustr. Ind. Zool.*

—*coromendelicus*, Geoffr. *Ann. Mus.* xiv. p. 16. tab. 5. fig. 1.

Cryptopus granosus, D. & B. *Erp. gen.* ii. p. 501.

Very abundant on the coast of Coromandel and in Lower Bengal; Allahabad, N. W. Hindostan, and Sikkim, length of shell 10 inches, is relished as food by particular castes.

Emyda ceylonensis.—Gray, *Shield, Rept.* p. 64. tab. 29 A.

Emyda punctata, Kelaart, *Prodr. Faun. Ceyl.* p. 179. *Bell, Testud.* c. tab. duab.

Scarcely specifically distinct from *E. granosa*. Generally distributed in the lower part of Ceylon found in lakes and tanks. Several were kept alive for months in a tub filled with fresh water fed freely on animal food, and also on bread and boiled rice. A large female laid three eggs, globular, about 1 inch in diameter, with a hard calcareous shell. This and *Emys trijuga* are put into wells to act the part of a scavenger. Shell, in fresh specimens smooth; in drying, the granular surface of the bony shell is apparent.

Emyda vittata. Peters, *Monatsber. Berl. Acad.* 1854, p. 216. Goa. Characterized by black streaks and spots on the head and the neck.

Trionyx, Geoffr. Shell much depressed, only partly ossified, covered with soft skin, dilated into a broad cartilaginous margin posteriorly. Sternum more or less cartilaginous, sometimes with two pairs of externally visible osseous plates, and with the hinder lobe not dilated into lateral valves. Feet broadly webbed, with three strong claws anteriorly and posteriorly. Muzzle produced into a nasal tube; snout conically pointed.

Trionyx sinensis. Wiegman, *Nov. Act. Acad. Leop. Carol.* xvii. 1835, p. 139. *Strauch. Chelonolog. Stud.* p. 177.

—*tuberculatus*, Cantor, *Ann. & Mag. Nat. Hist.* ix. 1842, p. 489.

Typhlopocellatus, Gray, *Catal. Tort. Brit. Mus.* p. 48.

Trionyx perocellatus, Gray, *Catal. Shield Rept.* p. 65. tab. 31.

The bony carapace rather longer than broad, with a low but very distinct vertebral ridge. Peculiar to China; found on the island of Chusan, common in Formosa.

Trionyx gangeticus. Cuv. *Regne. Anim.*

—*hurum*, Gray, *Illustr. Ind. Zool.* c. tab.

—*ocellatus*, Gray, *Illustr. Ind. Zool.* c. tab.

Gymnopus duvaucellii, Dum. & Bibr. *Erpet. gen.* ii. p. 487.

—*ocellatus*, Dum. & Bibr. l. c. p. 489. *Jacquem. Voy. Ind.*, Sept. pl. 9.

—*gangeticus*, Cantor, *Mal. Sept.* p. 8.

Bony carapace rather longer than broad, with a slight swelling anteriorly on the vertebral line. Found in the Ganges and its tributaries, upwards to Nepal; at Penang in rivers and on the sea-coast. It is of fierce habits, defending itself desperately by biting, and emitting when excited a low, hoarse, cackling sound. It appears to be far less numerous at Penang than *T. javanicus* and *Chitra indica*. Shell 23 inches long.

Trionyx javanicus. Schweigg. *Prodr.* p. 287. Gray, *Illustr. Ind. Zool.* c. tab.

Gymnopus javanicus, Dum. & Bibr. *Erpet. gen.* ii. p. 493.

—*cartilaginea*, (Boddaert) Cantor, *Cat. Rept.* p. 9.

Found in the Ganges and its tributaries in the Dekhan and at Penang is numerous.

Trionyx ornatus. Gray, *Proc. Zool. Soc.* 1861, p. 41. pl. 5. (young). 7 inches long Siam; Gamboja, Borneo.

Trionyx subplanus. Schweigg. *Arch. Konigsb.* i. p. 289. Gray, *Ill. Ind. Zool.* c. tab.

Gymnopus subplanus, Dum. & Bibr. *Erpet. gen.* ii. p. 496.

Trionyx frenatus, Gray, *Shield, Rept.* p. 67.

Dogania subplana, Gray, *Shield Rept.* p. 69. tab. 33 (from a Japanese specimen).

Found at Singapore, Penang, and Japan.

Trionyx guntheri.—Muller.

Dogania guntheri, Gr. *Pr. Zo. Soc.* 1862, p. 265.

Bony carapace as broad as long, much depressed, especially along the vertebral line.

Chitra. Gray. Very closely allied to *Trionyx*, differing only in the form of the head; the hind part of the head is more elongate, whilst the snout is short, with very thick lips and with a short, prominent nasal tube.

Chitra indica. Gray, *Shield, Rept.* p. 70.

Trionyx indicus, Gray, *Syn. Rept.* p. 47.

—*egyptiacus*, var. ind. Gr. *Ill. Ind. Zo.* c. tab.

Gymnopus lineatus, Dum. & Bibr. *Erpet. gen.* ii. p. 491.

—*indicus*, Cantor, *Mal. Rept.* p. 10.

Grows to a very large size, and, like the *Trionyx*, is eaten by the natives, particularly the Chinese. Found in the Ganges and in its tributaries, upwards into Nepal; frequent in the estuaries of the Malayan Peninsula, and

said to be in the Philippine Islands. Specimens weigh 240 pounds; they are very powerful and of ferocious habits. Shell measures 37 inches.

FOURTH FAMILY.

Chelonidæ. Marine Turtles.

Marine Turtles are at once distinguished by their long, compressed fin-shaped, non-retractile feet, the toes being enclosed in a common skin, out of which only one or two claws project. The carapace is broad and much depressed, so that when these animals are on shore and are turned over on their backs, they cannot regain their natural position. They are thoroughly marine animals; their pinnate feet and their light shells render them the best swimmers in the class of reptiles; they sometimes live hundreds of miles distant from shore, to which they periodically return, in order to deposit from 100 to 250 soft-shelled eggs, which are buried in the sand. The food of some species consists exclusively of algæ; others subsist upon fish and mollusca. They are found in all the intertropical seas; sometimes they travel far into the temperate regions. The flesh and eggs of all the species are edible, although the Indian turtles are much less appreciated in this respect than those of the Atlantic. At certain seasons, the flesh of *Chelonia virgata* acquires poisonous qualities, and instances of death have been ascribed to its use.

Caouana, Gray, has fifteen vertebral and costal shields, which are thin and not imbricate. There is a ridge or a series of prominent knobs along the rows of vertebral and costal shields in young animals. The genus is carnivorous, eating fishes, mollusca, and crustacea: comprises an Atlantic species, the Loggerhead, which does not appear to extend into the Indian Ocean, and *C. olivacea* confined to the East Indies.

Caouana olivacea. The Indian Loggerhead. *Chelonia olivacea*, Eschscholtz, Zool. Atl. tab. 3. Cantor, Catal. Mal. Rept. p. 13.

C. dussumieri, D. & B. Erpet. gen. ii. p. 557.

Caouana olivacea, Gray, Cat. Shield Rept. p. 73.

This species is distinguished from its Atlantic congener by the presence of only a single small claw to each of its feet. It has been found in the Bay of Bengal, on the coasts of Malabar and Penang, in the seas of the Philippine Islands and of China, and is abundant at the mouth of the Hoogly. Its flesh, though relished by the Chinese is unpalatable to Europeans.

Chelonia. (Flem.) Gray, Shield. Rept. p. 74. has thirteen vertebral and costal shields, which are thin and not imbricate. Shell of young animals without, or with feeble, longitudinal ridges. Herbivorous, feeding on algæ. Species

of *chelonia* extend over nearly all the seas between the tropics; but whether they belong to two or more species is a question which cannot be decided in the present state of our knowledge. *C. midas* and *C. viridis* are names given to specimens from the Atlantic, and India. Both names are now considered to indicate the same species, *virgata* has been applied to specimens from the Red sea, identical with others from the Indian ocean. Dumeril and Bibron apply it to Atlantic as well as to Indian specimens and Cuvier and Duméril and Bibron distinguish *Ch. maculosa* from the coast of Malabar, and *Ch. marmorata*, from the Atlantic. Gray and Agassiz, consider both of them as identical, and the former author as even synonymous to *Ch. virgata*. The differences consist chiefly in modifications of the colours and in the form of the shields, Agassiz has retained the name of *Ch. midas* for the Atlantic individuals, and of *Ch. virgata* for those from the Pacific. *Chelonia virgata*, the Indian Turtle, or Green turtle, is found on all the coasts of the East Indies. It is at all seasons plentifully taken in fishing-stakes in the Straits of Malacca; in size it equals the Atlantic Turtle, which it rivals in flavour. About December and January the female lands to deposit her eggs, in the sandy beach of some sequestered island, and then the fishermen watch during the moonlight nights to 'turn turtles.' The eggs are of a spherical shape, about 1 inch in diameter, covered by a soft semi-transparent membrane of a pale-yellow colour. The expert eye of the fisherman baffles the pains with which the turtle conceals her eggs, and prodigious numbers are disinterred. They are very rich-flavoured, like marrow, and will keep for weeks although exposed to the air. The flesh of this species is sometimes found to be poisonous.

Caretta, Merr. Gray, } *Shield*, Rept. p. 73. has thirteen vertebral and costal shields, which are produced behind and imbricate. Two claws to each foot. Shell of young animals with three keels.—Carnivorous.

Caretta squamata. Hawk-bill Turtle; Indian Caret.

Caretta imbricata (part), auct.

Testudo squamata, Bont. Jav. p. 82.

Eretmochelys squamata, Agass. Nat. Hist. U. States, i. p. 382.

Linnaeus, in his 'Systema Naturæ,' enumerates the species of turtle famous by the tortoise-shell which it supplies to commerce, as *Testudo imbricata*, referring to it specimens from the Atlantic as well as from the Indian Ocean, and quoting the Javan *Testudo squamata* of Bon-tius as a synonym. All subsequent zoologists have adopted Linnaeus's view, until the Indian Caret was separated from the Atlantic form by

L. Agassiz (Nat. Hist. United States, i. p. 382), under the name of *Eretmochelys squamata*. Very small horny scales are imbedded in the skin of the neck; the median keel extends generally over all the vertebral shields; other ridges diverge from the point of each vertebral shield. The costal shields also have sometimes prominent ridges, commencing at the angles they form with the marginal plates and running to the point of each costal. The Hawk-bill Turtle, is so named from its rather elongate and compressed, curved upper jaw, does not attain to the same size as the other turtles: a shell 2 feet long is considered as extraordinarily large. It is found throughout the East Indian Archipelago, is plentiful only on parts of the coasts of Ceylon (Hambantotte, Matara), of the Maldives, of Celebes, &c. As however, turtles always resort to the locality where they were born, or where they have been used to propagate their kind, and as their capture is very profitable, they become scarcer and scarcer at places where they are known to have been abundant formerly, some specimens sell in Ceylon for as much as £4, the price depending on the quality of the shell. If taken from the animal when decomposition has set in, the colour of the shell becomes clouded and milky, and hence the cruel expedient is resorted to of suspending the turtle over fire till heat makes the shields start from the bony part of the carapace, after which the creature is permitted to escape to the water, where they live; but reproduction of the epidermal shields to a great extent is improbable. At Celebes, whence the finest tortoise shell is exported to China, the natives kill the turtle by blows on the head, and immerse the shell in boiling water to detach the plates: dry heat is only resorted to by the unskilful.

Dermatochelys, Blainv. Carapace subcordiform, covered with a coriaceous skin like the remainder of the animal. Herbivorous.

Dermatochelys coriacea.

Testudo coriacea, L. Syst. Nat. i. p. 350.
Sphargis mercurialis, Merr. Tent. p. 19. Schleg.
Faun. Japon., Rept. p. 6, tab. 1.
—coriacea, Gray, Syn. Rept. p. 51. Dum. & Bibr. Erpet. gen. ii. p. 560. pl. 24. fig. 2. Tickell.
Journ. As. Soc. Beng. 1862, p. 367, c. fig.

Shell above with seven longitudinal ridges, separated from one another by grooves. Skin smooth in adult specimens, tubercular in young ones. This turtle, although scarce, appears to be spread throughout almost all the seas of the tropical and temperate regions, having been found in the Mediterranean, on the south coast of England, in the West Indies, at the Cape of Good Hope, on the coasts of the United States, in Chili, in Japan and in India. A female

caught on the coast of Tenasserim, of entire length 6 feet 2½ inches.

THE ORDER OF LIZARDS—SAURIA.

Anterior ribs generally joined to a sternum. Tail more or less long. Jaws toothed; the mandibles united in front by an osseous suture. Limbs generally four, sometimes rudimentary or not visible externally. Eyelids generally present. Integuments with scale-like folds or osseous scutes, or granular. The greater portion of the Saurians are easily distinguished from the other orders of reptiles by their elongate form, by their moveable thorax covered with skin, by the presence of legs, and by their general integuments, which are either folded into scales, or granular, or tubercular, or shielded. Still, there are many saurians which, at a superficial glance, might easily be taken for members of order—of snakes, and there is a gradual transition between both these orders. Many lizards have several layers of cells loaded with different pigments; the animal spreads or compresses these layers by more or less inflating its lungs, whereby the changes in the coloration are effected. Saurians are oviparous; a few ovoviviparous. They have been divided into many families;

Family of Crocodiles—Crocodylidae.

Head with the snout produced; body depressed, covered above and below with square shields arranged in longitudinal and transverse series; each dorsal shield is composed of an osseous dermal scute and of a corresponding horny epidermal plate. Tail elongate, compressed. Feet short, more or less webbed. Teeth strong, acute conical, in a single series. Tongue short, adherent. Nostrils small, situated close together, on the top of the extremity of the snout. Toes 5—4; only the three interior are armed with claws. Fresh-water saurians are found between the tropics wherever the country is watered by sufficiently large rivers or lakes. Peculiarities have induced many zoologists to consider the Crocodylians either as a distinct sub-order of the Saurians (Loricati) or to separate them altogether as an order intermediate between the Tortoises and Lizards (Emydosauri). The most conspicuous characters of the crocodiles refer to their thoroughly aquatic life; but these characters are combined with an extremely powerful development of those organs which render the crocodiles the most formidable of all the carnivorous fresh-water animals. The back, the tail, and the belly are protected by a dermal armour composed of quadrangular shields, which are arranged in regular longitudinal and transverse series. A considerable proportion of the food of the crocodile is fish, the proverbial swiftness of which is of little avail when pursued by these

reptiles ; they fall an easy prey especially to the young animals, the active old animals requiring a greater quantity of food, attack every large animal which accidentally approaches them, and, in overpowering it, the whole of their powerful organization is called into requisition. Seizing the victim between their capacious jaws, and fastening their long, pointed, conical teeth into its flesh, they draw it, in one moment, by their weight and with a stroke of the tail, below the water and drown it. Their gullet, however, is much too narrow to allow of the passage of the entire body of the victim ; and their teeth being adapted for seizing and holding fast only, and not for biting, they are obliged to mangle the carcase, tearing off single pieces by sudden strong jerks. This is performed chiefly by lateral motions of the head and front part of the body ; and the bones of the head of the crocodile are much more firmly united with one another, and the processes of the cervical vertebræ much more developed, than in any other saurian. Indian crocodiles inhabit rivers and estuaries, also the sea-coasts, and in calm weather may be seen floating at a distance of two or three miles from shore. Those inhabiting small inland waters which are dried up during a drought are compelled to wander about in search of water, in which alone they can procure their food ; they do this during the night. Some of them, however, especially large individuals, bury themselves in the mud, as many fresh-water tortoises and fish do, and remain in a state of torpor below the hard crust during the time of the drought. It is during that period, shortly after they have been released from the state of an enforced fasting, that they are most formidable. A man seized by a crocodile has only one way of saving his life, if not his limb, namely to force his fingers into the eyes of the beast, which immediately lets go its victim, a practice equally known to the Indian of South America, to the Negro of Africa, and to the Hindoo. It is not difficult to catch a single depredator by a hook baited with flesh or entrails, and made fast by a bunch of strong, thin cords, which it cannot gnaw asunder, as they sink into the spaces between the teeth. It is not easy to kill them on the spot, except by a ball sent through the eye into the brain, or through the neck to the spinal cord : of course, a severe injury to any of the vital parts will prove fatal to them, but not before days or weeks have elapsed. All the crocodiles are oviparous : the eggs have a hard shell, and resemble in size and shape those of a goose ; from twenty to sixty are deposited in a hollow near the banks, and slightly covered over with mould or sand. The young crocodiles are of a rather rapid growth, one hatched at Madras in eight years increased to the length of 8 or 9

feet, and was so powerful as to destroy a full-grown buck antelope, which had come to drink water at the tank to which it usually resorted.

Crocodiles, Owo. Teeth strong, very unequal in size, 18 or 19 above, and 15 below, on each side, the teeth in the upper jaw being the strongest ; the fourth tooth of the lower jaw passes into a groove at the lateral edge of the upper jaw. Snout moderately long. The posterior nuchal plates are separated from the dorsal by an interspace. Alligators are found only in the new world, but the British in India, almost universally apply this name to the Indian *Crocodilus*. *Crocodiles* are found in America, Africa, Asia, and Australia.

Crocodilus palustris. Less. in *Belang. Voy. Ind. Orient.*, *Zool. Rept.* p. 305. Gray.

Opholis porosus, Gray, *Ann. & Mag. Nat. Hist.* 1862, x. p. 267.

Anterior nuchal plates none, or only a pair of very small ones. E. Indies. Australia.

Crocodilus pondicerianus. Gunther.

Opholis pondicherianus, Gray, *Ann. & Mag. Nat. Hist.* 1862, x. p. 268.

No anterior nuchal plates. Penin. of India.

Gavialis, Geoffr. Teeth slender, subequal in size, 27 or 28 above, and 25 or 26 below, on each side ; the strongest teeth anteriorly in the jaws ; teeth directed outwards. Snout very long and slender. Only one species is known from the Ganges,—the Borneo gavial *Crocodilus schlegelii*, having been referred to *Rhynchosuchus*.

Gavialis gangeticus. The Gavial or Nakoo-
Lacerta gangetica, Gm. *Syst. Nat.* i. p. 1067.

Crocodilus longirostris, Schneid. *Hist. Amph.* p.

160. *Cuv. Oss. Foss.* v. pt. 2. p. 60. pl. I. figs. 2. 1 & 10 & pl. 2. fig. 11 (head and skull.)
 — *tenuirostris*, *Cuv. L. c.* p. 62. pl. 1. figs. & 11, & pl. 2. fig. 12.

The length of the snout equals that of nine or ten of the dorsal shields. Old male specimens have a large cartilaginous hump on the extremity of the snout, *Ælian* noticed that the *Ganges* is inhabited by crocodiles which have a horn on the end of the snout, perforated by the nostrils and containing a small cavity for the reception of air, so that the males are enabled to remain under water for a longer time than the females. The *Gavial* attains to a length of 20 feet. The correct term is *garial*.

Family of Water Lizards.—*Varanidæ*.

Head with the snout produced, pyramidal, covered with small, scale-like, but not imbricate, shields. Teeth acute, compressed. Tongue elongate, slender, terminating in a long fork, retractile into a sheath at its base. Scales small, equal on the sides and on the back, arranged in cross rings; those of the belly and tail square, in cross bands. Tail long, generally compressed. Toes 5—5, armed with strong claws. This family contains the largest species of lizards; the greater part of them live in the neighbourhood of large rivers, and are excellent swimmers, their long, compressed tail serving as a propeller; they are carnivorous, feeding on all the different water-animals and on the eggs of birds, and likewise on those of other large reptiles. Their movements on land are not much less rapid than in the water. Several species climb trees; they are active during a part of the night. They are found in tropical Africa, Asia, and Australia.

Varanus. (part), *Merr. Amph.* p. 58. nostrils are an oblique slit, situated in, or nearly in, the middle between the eye and the extremity of the snout. Scales elliptic, small; those on the back and on the sides not imbricate, each being surrounded by a small, circular, granular fold. Tail with a low crest, formed by two or four series of strongly keeled scales. Throat with a transverse fold.

Varanus flavescens. Short-toed Water Lizard.

Monitor flavescens, *Gray, Ill. Ind. Zool.* c. tab.
Varanus piquotii, *D. & B. Erpét. gén.* iii. p. 485.
Empagusia flavescens, *Gray, Lizards*, p. 9.
Varanus flavescens, *Cantor, Mal. Rept.* p. 28.

This species attains to a length of from 3 to 4 feet, the tail being longer than the body. Its toes comparatively shorter than in its congeners.

Varanus dracæna. Common Indian Water Lizard.

? *Lacerta dracæna*, *L. Syst. Nat.* i. p. 360.
Lacerta dracæna, *Shaw. Zool.* iii. p. 218. pl. 67.
Tupinambis bengalensis, *Daud. Hist. Rept.* iii. p. 67.

Varanus guttatus, *Meer. Amph.* p. 58. *Less. in Bélang. Voy. Ind. Orient., Rept.* p. 308.

Varanus bibroni, *Blyth, Journ. As. Soc. Beng.* xi. p. 869, *Kalzaart, Prodr. Faun. Ceyl. App.* p. 46.

A most common species in all British India, Bengal, Nepal, Southern India, and Ceylon, it is called in Ceylon the "Goana," is found in great abundance in all the maritime provinces, rarely in the higher Kandian districts.

Varanus lunatus. *Gray, Lizards*, p. 10. Banded Water Lizard.

Sides and legs dotted with white.

Varanus nebulosus. Clouded Water Lizard, Bengal, Siam, Penang.

Monitor nebulosus, *Gray, in Griff. An. Kingd.* ix. p. 27.

Varanus nebulosus, *Dum. & Bibr. Erpét. gén.* iii. p. 483. ? *Cantor, Cat. Mal. Rept.* p. 27.

The largest specimen seen is 3½ feet long, the tail being longer than the body; is found in Bengal and Siam, perhaps near Penang, but not in Java as stated by Bibron.

Hydrosaurus, *Wagl.* This genus differs from *Varanus* only in its nostrils, which are a more or less rounded opening near the extremity of the snout.

Hydrosaurus salvator. *Gray* Ocellated Water Lizard.

Stellio salvator, *Laur. Syn. Rept.* p. 56.

Tupinambis bivittatus, *Kuhl, Beitr. Zool.* p. 125.

Monitor elegans, *Gray, Zool. Journ.* iii. p. 225.
Varanus vittatus, *Less. in Bélang. Voy. Ind. Orient., Rept.* p. 307.

— *bivittatus*, *D. & Bibr. Erpét. gén.* iii. p. 486.

Varanus salvator, *Cant. Cat. Mal. Rept.* p. 29.

Monitor bivittatus, *Schleg. Abbid.* p. 76. tab. 21, & tab. 22. figs. 1, 2.

An inhabitant of the Archipelago; East Indian continent; China, Siam, Ceylon. It is "very numerous in hilly and marshy localities of the Malayan peninsula. It is commonly, during the day, observed in the branches of trees overhanging rivers, preying upon birds and their eggs and smaller lizards, and when disturbed, it throws itself from a considerable height into the water; it will courageously defend itself with teeth and claws and by strokes of the tail, low castes in India dig them out of their burrows on the banks of rivers, their flesh being greatly relished. Some attain to nearly 7 feet in length."

Family of Land Lizards.—*Lacertidæ*.

Head covered with shields, which are symmetrically arranged. Tongue slender, free

exsertile, terminating in a fork. Scales on the back granular or rhombic, on the sides granular; on the belly larger, quadrangular or rounded, and arranged in cross bands. No longitudinal fold along the sides, but generally a fold across the throat. Tail very long, rounded, with the scales arranged in rings, fragile. Eyes diurnal, with eyelids; tympanum distinct. Limbs four, well developed. The species do not attain to any considerable size, most of them are found in Africa, America and Europe. They live generally on the ground and are not burrowing.

Tachydromus, Daudin.

Head elongato-pyramidal, body subcylindrical, tail very long. Nostril in a single nasal shield immediately above the labials. Dorsal scales large, strongly keeled, the keels being confluent into longitudinal ridges; all the ventral shields, or at least the lateral ones, keeled. Sides covered with granular scales. Anal shield surrounded by smaller ones; one or two inguinal pores on each side. Femoral pores none. Tail with rings of keeled, quadrilateral shields. An indistinct collar. Toes not serrated or keeled. Tympanum distinct.

Tachydromus sexlineatus. Daud. Rept. iii. p. 256. tab. 39. D. & B. Erpét. gén. z. p. 158.

T. quadrilineatus, Daud. l. c. p. 252.

T. typicus, Gr. in Mus. Nat. Hist. i. p. 389.

This species occurs at Rangoon, Borneo. The largest is 14 inches long, of which the tail takes 11½.

Tachydromus meridionalis. Has hitherto been confounded with *T. sexlineatus*. It is as slender as the species from the Archipelago, with the snout produced and with the tail exceedingly long. Back brownish olive; a dark brown band runs from the snout, through the eye, above the tympanum, to the loins; this band is separated from the colour of the back by an iridescent lateral stripe. Found in China, probably also in Cochin-china. Head 5 lines, trunk 18 lines, tail 7½ inches.

Tachydromus septentrionalis. The most northern of the *Tachydromi*, is more closely allied to the Japanese species than to any other.

Back brownish or greenish-olive; a brown band, darkest on its edges, runs from the nostril through the eye to the tympanum, and is soon lost. There is a green, iridescent, black-edged band on each side of the back in old specimens. Lateral parts greenish, the lower yellowish specimens procured at Ningpo, head ¾ of an inch, trunk 2 inches, tail 7 inches.

Cabrita, Gray.

Nostrils on the ridge of the snout, between an upper and lower nasal plate, both being

rather swollen; a small hinder nasal. Eyelids present; collar none, only a small fold before each shoulder. Ventral scales four-sided, smooth, longitudinally arranged. Femoral pores. Toes 5—5, keeled beneath, not toothed on the sides.

Cabrita leschenaultii, Gunther.

Lacerta leschenaultii, Milne-Edw. Ann. Sc. Nat. xvi. pp. 80, 86. pl. 6. fig. 9 (head).

Cadrosaur leschenaultii, D. & B. Erp. gén. v. p. 282.

Cabrita brunnea, Gray, Ann. Nat. Hist. i. p. 282.

Two loreals; the central occipital very small; length 5½ inches, head and trunk 2 inches: said to be from the Coromandel coast, it is somewhat locally distributed, seen in Salem, Coimbatore near the banks of the Caverry. Find Dadun Khan, in the Punjab Salt Range; and Afghanistan. It frequents bushy ground, hedges of *Euphorbia* and clumps of *Cactus*.

Ophiops, Menetries.

Nostrils on the ridge of the snout, between an upper and lower nasal plate, both being rather swollen; three small shields behind the nostril. Eyelids none; collar none, only a small fold before each shoulder. Ventral shields four-sided, rhombic, smooth; scales on the back rhombic, keeled, imbricate. Femoral pores. Toes 5—5, keeled beneath, not toothed on the sides.

Ophiops jerdoni (Journ. As. Soc. Beng. xxii. p. 653):—Dark bronze above, black-spotted, with two obscure broad dorsal streaks; below white throughout. Femoral pores seven or eight. Shields of head plaited longitudinally. Length of head and body 1½ inch, of tail 2½ inches, of hind limb ¾ inch. Procured at Mhow, in pasture land.

Acanthodactylus, Fitzinger.

Nostril between three shields, the lower of which is the first labial. Eyelids present; a small fold across the throat. Ventral scales four-sided, smooth. Femoral pores. Toes 5—5, keeled beneath, and toothed on the sides. The species are African; and East Indian.

Acanthodactylus neilgherrensis, Jerd. (Journ. As. Soc. Beng. xxii. p. 476):—Anterior edge of ear toothed, scaly; collar transverse; scales of back somewhat larger behind than in front; an occipital plate. Obtained near Coonoor.

Acanthodactylus Cantoris. Head of moderate length with the snout narrowed; body and root of the tail rather depressed; limbs well developed. Total length 7 inches:—head 7 lines; tail 4½ inches; fore limb 11 lines; fourth (longest) finger 3½ lines; hind limb 18 lines; third toe 3½ lines; fourth (longest) toe 6 lines; fifth toe 5 lines.

Family of *Cordyles*—*Zonuridae*.

Head covered with regular, symmetrical;

many-sided shields. Tongue flat, nicked. Scales of the back and tail large, squarish sides with a distinct longitudinal fold ; scales of the belly square or roundish, in cross bands. Tail rounded. Ears distinct ; eyes diurnal with lids. Only one species of this family is found in the East Indies.

Pseudopus.

Pseudopus et *Hyalinus*, *Merm.*

Seps (part.) et *Ophisaurus*, *Baudin.*

Pseudopus, *Ophisaurus*, et *Dopasia*, *Gray.*

Ophiseps, *Blyth.*

Three species only of this very remarkable genus are known : one from North America, *Ophisaurus ventralis*, with the palatine teeth in a broad band ; the second from South-Eastern Europe and Northern Asia, *Pseudopus pallasii*, with rudimentary hind limbs ; and, finally, the *Ps. gracilis* from Khasya.

Pseudopus gracilis. Khasya Glass Snake. *Gray Lizards*, p. 56.

Dopasia gracilis, *Gray, Ann. & Mag. Nat. Hist.* xii. 1853, p. 339. *Günth. Pr. Z. Soc.* 1860, p. 172.

Ophiseps tessellatus, *Blyth, J. A. S. B.* xxii. p. 655.

The typical specimen is from the Khasya Hills, 15 inches long, the tail measuring 10. Whilst in other Saurians the whole skin of the belly and of the sides is extensible, the extensibility here is limited to a separate part of the skin.

Family of Skinks—Scincidæ.

Head covered with shields, which are symmetrically arranged. Tongue slender, free, exsertile, terminating in two pointed lobes. Scales on the back rounded, quincuncial, imbricate ; those on the belly similar to those on the back and on the sides. No fold across the throat or along the side ; no femoral or inguinal pores. Tail generally long, rounded, fragile. Eyes and eyelids well developed. Nostrils in a separate plate, between the frontal and labial shields. Generally four limbs, moderately developed, sometimes feeble or hidden below the skin. The species of this family are exceedingly numerous, and inhabit almost every part of the tropical regions, some extending into the temperate zones. They are thoroughly land Lizards, preferring dry ground, and hiding themselves in the sand, under stones, &c.; none of them enter the water. They do not attain to any considerable size, a few West Indian and Australian species growing to the thickness of a man's wrist, and exceeding a foot in length. They deposit from eight to twelve globular eggs.

Tropidiphorus, *Dum. & Bibr.*

Each scale with a strong keel ; tail longish, rounded, the keels of their scales being very prominent, forming series of spines, nostril in a single small shield. Two or three large pre-

anal shields, limbs four, moderately developed, each with five toes, only three species are known.

Tropidiphorus macrolepis, *Günth. Pr. Z. S. Ap.* 23. 1861, p. 188. From Chartaboum on the Coast of Siam. It is 5½ in. long, tail 3½ brownish gray, slightly marbled with darker, toes and lower part of the tail dotted with brown.

Tropidiphorus Cochinchinensis, *Cuv. Regne Arant D. & B. Günth. Tr. Montanus Gray, in Gr. An. King.* iv. p. 35. Cochinchina.

Snout rather more obtuse than in *Tr. Microlepis*.

Aspris Berdmorei. *Bl. J. & S. Beng.* xii. p. 650. Mergui has a compressed and subacute snout.

Euprepes. *Wagler.*

Each scale with several keels. Tail longish, rounded, without spines. Nostril in a single small shield. Limbs four, each with five toes. The palatol notch is placed far backwards. This genus has nearly the same geographical distribution as *Eumeces*, and is also very rich in species. Those belonging to the East Indian fauna are less numerous, and may be distinguished as follows :—

Euprepes chinensis.

Ateuchosaurus chinensis, *Gray, Lizards*, p. 107.

Only one specimen is known. It is 3 inches long, of which the tail takes rather more than one-half. China.

Euprepes rufescens. Common Indian Skink.

Iacerta rufescens, *Shaw, Zool.* iii. p. 285.

Scincus multifasciatus, *Kuhl, Beitr.* p. 12.

Tiliqua rubriventris, *Gray, Ind. Zool.*, and *Ann. & Mag. Nat. Hist.* 1846, xvii. p. 430.

T. carinata, *Gray, Zool. Journ.*

T. affinis, *Gray, Ann. Nat. Hist.* ii. p. 269.

Euprepes sebae, *D. & B. Erp. gén.* v. p. 692.

Tiliqua rufescens, *Gray, Lizards*, p. 109.

Euprepes rufescens, *Cant, Cat. Mal. Rept.* p. 46.

Plestrodon sikkimensis, *Gray, Ann. & Mag. Nat. Hist.* 1853, xli p. 388.

The coloration varies :—

a. Specimens from Madras and from the Deccan have a very distinct yellowish band.

b. Specimens from Ceylon have the yellowish bands less distinct than the former.

c. There is no trace of a whitish band in a specimen from Afghanistan.

d. Penang, Siam, and the East Indian Archipelago are inhabited by three varieties.

This is one of the most common and most widely spread Lizards of the East Indies ; it occurs in almost every part of the continent as well as of the Archipelago, from Afghanistan to China and to the Philippine Islands ; it is even said to inhabit the Sandwich Islands. With regard to its altitudinal extent, it is not found beyond an elevation of 8,000 feet. Cantor says that it is exceedingly numerous in the hills and valleys of the Malayan coun-

tries. They may be seen basking in the sun, in bamboo hedges, or on trees; and they fearlessly enter houses in pursuit of insects, in which they display great agility. The female deposits six to twelve yellowish-white, oval, cylindrical eggs, half an inch in length."

Tiliqua trivittata, Gray. *Ind. Zool. c. fig.*, and *Jerd. Journ. As. Soc. Beng.* xxii. p. 478, appears to be a variety of this species.

Euprepes monticola. This species is found in Sikkim, at an altitude of above 8,000 feet, where it represents the *E. rufescens* of the lowlands, from which it may be distinguished by its scales, which have two keels only. An adult female specimen is $8\frac{1}{2}$ inches long, of which the tail takes 5.

Euprepes olivaceus.

Dasia olivacea, Gr., *Mag. Nat. Hist.* ii. p. 331.

Euprepes ernestii, Dum. & Bibr. *Erpet. gén.* v. p. 696. *Cantor, Mal. Rept.* p. 47.

Upper parts brownish, with about twelve narrow, irregular, black transverse streaks, each black scale having a white spot. A whitish band along each side of the root of the tail. Lower parts greenish olive.

This species is less numerous than *E. rufescens*; it has been found on the Malayan Peninsula and on Prince of Wales' Island; a specimen in the Paris Museum is said to have been captured in Java. The largest individual is nearly 9 inches long, of which the tail takes rather more than one-half. Cantor found eleven eggs in a female, similar to those of *E. rufescens*.

Euprepes macularius, Blyth. *J. A. S. Beng.* xxii. p. 652.

Rungpore, like *E. rufescens*, Bronzed olive green above, pale below: length $5\frac{1}{4}$ in. tail $3\frac{1}{2}$.

Euprepes trilineata, Gray, *Mag. Nat. Hist.* 1846, xvii. p. 430. *Jerdon, J. A. Soc. Beng.* xxii. p. 479.

Yellowish olive, with three yellowish-white longitudinal bands only in sandy ground near the sea in the Carnatic, concealing itself in holes and fissures, and under shrubs. It attains to a length of 7 inches, of which the tail is nearly 4.

Mabouia, Fitzinger.

Scales thin, smooth, polished, not keeled. Tail rather long, rounded, without any keels or spines. Nostrils in a single, small shield. Limbs four, each with five toes. Palate with more or less distinct teeth, the palatal notch being placed on the level of the eye. Only two or three species are found on the East Indian continent.

Mabouia quadrilineata.

Plestiodon quadrilineatus, Bl., *J. A. S. Beng.* xx.i. 652.

Eumeces quadrivirgatus, Hallow. *Proc. Acad. Nat. Sc. Philad.* 1860, p. 502.

Upper parts black, with a pair of whitish lines along the back, the lines beginning from the nose and the superciliaries; no median white line; another line commences at the tympanum and runs along the middle of the side. Lower parts whitish. Hongkong, length 6 inches, head and trunk measuring $2\frac{1}{2}$.

Mabouia chinensis. The Chinese Skink.

Tiliqua chinensis, Gr., *Ann. Nat. Hist.* i. p. 289.

Plestiodon sinense, D. & B. *Erpet. gén.* v. p. 704.

Tiliqua rugo-guttata, Cant. *Mag. N. H.* 1842, ix. p. 432.

Plestiodon chinensis, Gray, *Lizards*, p. 92.

Limbs well developed: the fore legs extend to the snout, the hind legs half way or more than half way up towards the axil. The coloration changes with age. The Japanese specimens are specifically identical with those from North America, both constantly differing from the Chinese ones in having an additional small shield between first loreal and nasal.

Mabouia maculata.

Lissonota maculata, Bl., *J. A. S. Beng.* xxii. p. 653.

This species is apparently allied to *Mabouia chinensis*.

Eumeces, Wiegmann.

Scales thin, smooth, polished, not keeled. Tail more or less long, rounded, without any keels or spines. Nostril in a single small shield. Limbs four, each with five toes. Palate without any teeth, the palatal notch being placed far backwards, behind the level of the eye. The species of this genus are very numerous and spread over nearly all the different countries between, or near, the tropics.

Eumeces bilineatus. The black-striped Skink.

Mocia bilineata, Gray, *Ann. & Mag. Nat. Hist.* 1846, xviii. p. 430. *Jerd. J. A. S. Beng.* xxii. p. 477.

Supra nasal shield none; the lower eyelid is transparent. Brownish olive above, greenish below. Discovered by Jerdon under stones on the summit of the Neilgherries. Length 5 inches, the head and trunk measuring half of it.

Eumeces himalayanus. Supranasal shield none; the lower eyelid is transparent, greenish line above, with interrupted whitish lines and series of blackish dots; sides with a dark band, which has a narrow greenish-white edge above and a broad one below; the lower parts greenish, each scale with a darker margin.

Specimens were procured in the Himalayas, Kashmir; from Garhwal and Simla. The largest is 4 inches long, the tail measuring half.

Eumeces schlegelii.

Tiliqua schlegelii, Günth., *Pr. Z. S.* 1860, p. 253, pl. 15. fig. C.

Supranasal shield none ; lower eyelid transparent.

Eumeces modestus. Supranasal shield none ; the lower eyelid is transparent. Limbs rather feeble. Yellowish olive above, with indistinct and interrupted lines of black dots ; upper part of the sides with an undulated brown band ; lower parts whitish with some olive dots. 4 inches long, the head and trunk measuring $1\frac{1}{2}$ inch.

Eumeces reevesii.

Tiliqua reevesii, Gray, in *Ann. N. Hist.* ii. p. 292.
Hinulia reevesii, Gray, *Lizards*, p. 76.

Supranasal shield none ; lower eyelid transparent. Limbs rather feeble. Brownish above, yellowish below, a dark brown band running along the upper part of the side. It is a native of China.

Eumeces ladneensis. Supranasal shield none ; lower eyelid transparent. Limbs well developed. Greenish above, with longitudinal series of black dots ; sides with an obscure band ; lower parts greenish white. Head and trunk 2 inches long.

Mococa formosa, Blyth (*Journ. As. Soc. Beng.* xxii. 1854, p. 651), Blyth refers to Gray's genus *Mococa*.

Eumeces indicus.

? *Lygosoma dussumierii*, D & B. *Erp. gén.* v. p. 725.
Hinulia indica, Gr. *Mag. N.* II. 1853, xii. p. 388.
?? *Mococa sikimensis*, Bl. *J.A.S.B.* xxii. 1854, p. 652.

Limbs well developed, common in Sikkim ; said to come from Ningpo in China. From 8 to 10 inches long, of which the trunk takes 3 or $3\frac{1}{2}$ inches.

Eumeces taprobanensis. Kelaart, *Prodr. Faun. Zeyl. Rept.* p. 21.

Lygosoma fallax, Peters. *Monatsber. Berl. Acad.* 1860, p. 184.

Limbs rather short. Ceylon, said also, to be from Ningpo in China ; found at Newera Ellia.

Eumeces chalcides.

Lacerta chalcides, K. *Syst. Nat.* i. p. 369.

L. serpens, Bloch, in *Beschæft. Berl. Gesellsch. naturf. Freund.* ii. p. 28. tab. 2.

* *Scincus brachypus*, Schn. *Hist. Amph.* p. 192.

Lygosoma serpens, Gray, *Zool. Journ.* iii. p. 228.

L. aurata, Gray, in *Gr. An. Kingd.* ix. p. 72.

L. brachypoda, Dum. & Bibr. *Erpèt. gén.* v. p. 751.

Podophis chalcides, Gray, *Lizards*, p. 88.

Lygosoma chalcides, Cantor, *Catal.* p. 49.

Body and tail very elongate, with very short limbs, each with five minute toes. Supranasal none ; the lower eyelid is scaly 8 in., head and trunk 4 in. not thicker than a goose-quill. found in Java, Penang, Siam, and near Hongkong.

Eumeces siamensis of Siam. Limbs well developed ; the fore legs extend to the eye, the

hindlegs not quite to the axil. Uniform greenish olive above, whitish below ; a well-defined deep-black band runs from the snout along the upper part of the sides ; it is not margined with white, is closely allied to the West Indian *Mabouia agilis* ; 6 inches long, head and trunk measuring 2 inches.

Eumeces bowringii. Brownish olive above, with an indistinct dark line along each series of scales ; a brown band along each side of the back ; sides with interrupted series of dark-brown dots from Hongkong, $3\frac{1}{2}$ inches long, head and trunk $1\frac{1}{2}$ inch.

Eumeces albopunctatus. White-dotted Skink. *Riopa albo-punctata*, Gray, *Ann. & Mag. Nat. Hist.* xviii. 1846, p. 430. *Jerd. Journ. As. Soc. Beng.* xxii. p. 477.

Eumeces punctatus, var., Cant, *Mal. Rept.* p. 45. *En. Hardwickii* ant.

Back uniform olive coloured, or with a line of very small dots along each series of scales. Anterior part of the sides blackish brown, with numerous small white spots. Uniform whitish below. The largest specimen seen $4\frac{1}{2}$ inches long, head and trunk measuring $2\frac{1}{2}$ inches discovered in the Nellore district and Mergui.

Eumeces hardwickii. White-streaked Skink. *Riopa hardwickii*, Gray, *Lizards*, p. 96. *Jerd. Journ. As. Soc. Beng.* xxii. p. 478.

Mabouia elegans, Gray, *Lizards*, p. 95.

Back brownish with four series of black dots, and with a yellowish-white band arising from the nose and from the superciliaries ; a series of black dots along each edge of these bands ; each scale on the sides with a black dot, the upper dots being the largest and confluent. Lower parts uniform white attains to 4 or 5 inches, head and trunk 2 inches. Jerdon mentions a specimen 9 inches long, it is common in the Carnatic, found in Ceylon, Patna, and the Neilgherries.

Eumeces punctatus. The Dotted Skink.

Lacerta punctata, L. *Syst. Nat.* p. 369.

L. interpunctata, Gm. *L. Syst. Nat.* i. p. 1075.

Seps scincoides, Cuv. *Règne. Anim.*

Eumeces punctatus, Wieg. *Herp. Mex.* p. 36.

Riopa punctata, Gray, *Lizards*, p. 66.

Each scale with a black dot, the dots forming longitudinal series ; they are largest on the back of the tail, and sometimes entirely absent on the belly. The outer series of scales on each side of the back has very small dots found on the coasts of Malabar and Coromandel, in the neighbourhood of Madras, and in the Deccan. Kelaart (*Prodr. Faun. Zeylan.* p. 151) mentions it as inhabiting Ceylon, but this requires confirmation. It attains to a length of 12 inches, the head and trunk measuring 5 inches.

Eumeces isodactylus. The short-toed Skink Olive, upper parts with irregular confluent

Homonota fasciata, Jerdon, Journ. As. Soc. Beng. xxii, p. 468.

The Geckos do not attain to any considerable size, the largest species being from 10 to 14 inches long. They are carnivorous animals destroying insects, moths, and even the younger and weaker members of their own species; Geckos have even been seen devouring their own tail. They are of fierce habits, fighting between themselves, particularly when one has caught a larger insect than he is able to swallow at once. They make a spring at their victim. Their greediness has developed some intellectual faculties in the house Geckos: accustomed to be fed at a certain time with rice, &c., these little lizards will punctually make their appearance, and fearlessly take proffered food. Another peculiarity of the Geckos is that they are endowed with voice: in *Gecko guttatus* it is a shrill cry, sounding like "To-kee;" in *Gecko monarchus* it resembles the monosyllable "Tok," repeated six or eight times with increased celerity; in *Hemidactylus frænatus* it is a sharp quick call, like "chic, chic, chit," &c. They have several vernacular names in imitation of these sound as 'Too-kai, 'To-kee, Chcecha, Gokee, Keko, Gecko.

Gecko, Gray. Fingers and toes dilated in their whole length, with a series of undivided, imbricate, transverse plates below; only the short terminal joint is more or less compressed; four claws to each foot. Sides of the trunk without cutaneous appendage. The species of this genus are confined to the Old World; the following are found in British India:—

Gecko guttatus.

- Iacerta gecko*, L. Syst. Nat. i. p. 365.
L. teres et G. verticillatus, Laur. p. 44.
L. guttatus, Daud. iv. p. tab. 49.
L. verus, Merr. Amph. p. 42. Gr., Lizards, p. 160.
L. annulatus, Kuhl, Beitr Zool. p. 131.
Platydictylus guttatus, D. & B. Erp. gén. iii. p. 328. *Gecko reevesii*, Gray, Lizards, p. 161.

This is one of the most common species in British India, in Siam, Cochinchina, and Southern China; it is found on numerous islands of the Archipelago, but appears to be entirely absent in Ceylon; it frequents houses, and attains to a length of 10 or 12 inches.

Gecko stentor.

- Platydictylus stentor*, Cantor. Catal. Mal. Rept. p. 15.

The typical specimen, 16 inches long, and obtained from the villa on the Pentland hills at Penang, is the only one known to have been found; it is in the British Museum. The species, therefore, appears to be very scarce.

Gecko smithii. Gray, Zool. Misc. p. 57.

Described by Dr. J. E. Gray from a speci-

men in Fort Pitt Museum; is said to be from Penang.

Gecko monarchus. Gray, Lizards, p. 161.

- Platydictylus monarchus*, Dum. & Bibr. Erpét. Gén. iii. p. 335. Cantor. Catal. Mal. Rept. p. 19.

This species attains to a length of 7 inches; the newly-hatched animal is $2\frac{1}{2}$ inches long. It is found on the Philippine Islands, in Amboyna, Borneo, on the Malayan Peninsula, and in Ceylon. It possesses the power of changing its ground colour in a greater degree than any other Gecko. It is very numerous at Penang, swarming at night in rooms, occasionally giving out a sound resembling the monosyllable "Tok," repeated six or eight times with increased celerity. They are pugnacious among themselves, two or more sometimes fighting for an insect.

Gecko japonicus.

- Platydictylus japonicus*, Dum. & Bibr. Erpét. Gén. iii. p. 337.

- P. jamori, Schleg. Faun. Jap., Rept. p. 103. pl. 2. figs. 1-4.

Gecko chinensis, Gray, Zool. Misc. p. 57.

- Hemidactylus nanus*, Cantor, Ann. & Mag. Nat. Hist. 1842, ix. p. 482.

This species attains to a length of 5 inches; it is found in Southern Japan, China, Chusan, and Formosa. It is a house Gecko.

Gecko swinhonis. A single specimen, $4\frac{1}{2}$ inches long, was sent from Northern China.

Gecko subpalmatus. The single specimen observed was obtained from Chikiang (China); it is 4 inches long, the tail measuring one-half, and apparently a female.

Ptychozoon, Kuhl. Fingers and toes dilated, united in their whole length by a web, with a series of undivided, imbricate, transverse plates below; four claws to each foot, sides of the head, body, tail, and of the limbs with broad, wing-like expansions of the skin. Only one species is known.

Ptychozoon homalocephalum. The Flying Gecko.

- Iacerta homalocephala*, Crevelde, Schrift. naturf. Freund. Bert. iii. p. 266. tab. 8.

- Gecko homalocephalus*, Tiles. Mem. Acad. Pétersb. vii. tab. 10.

- Ptychozoon homalocephalum*, Kuhl, Isis, 1822, p. 475. Cantor, Mal. Rept. p. 20.

- Pteropleura horsfieldii*, Gray, Philos. Mag. ii. p. 56.

- Platydictylus homalocephalus*, Dum. & Bibr. iii. p. 339. pl. 28. fig. 6, & pl. 29. figs. 1 & 2.

This very handsome Gecko has all the general characters of the preceding genus, but its integuments are dilated into broad folds, forming wing-like expansions along the sides of the whole animal, somewhat resembling those of the Dragons in form and function. The ground-colour of the head and of the back yellowish-green olive, of the sides reddish

blackish spots. Limbs feeble. with very short toes.

Senira bi-color, *Gray*, Philippine islands, Gamboja, 8 in. long, tail 4 in.

Hagria. *Gray*. Scales smooth not striated or keeled, limbs short feeble, far apart, palate out teeth.

Hagria vosmaerii. *Gray*.

Campsodactylus lamarrei, *D. and B. v. p. 762*.

Snout conical; head brown; body and tail with alternate, brown and yellow lines.

Chiamela. *Gray*. Body and tail elongate, tapering, without any keels or spines.

Chiamela lineata, *Gray, A. & H. ii. 333*.

A slow worm-like lizard, locality unknown. Brownish with black lines corresponding to the series of scales.

Anguis melanostieta, *Russell*.

Tortrixmelanostieta. *Gray*.

Ventral shields 151, sub-caudals 120. Cor. Coast.

Family Acontiadiæ or Acontiads.

Head covered with shields which are symmetrically arranged. Tongue free, exsertile, nicked at the end. Scales on the back rounded, quincuncial, imbricate; those on the belly similar to those on the back and on the sides. No fold across the throat or along the side; no femoral or inguinal pores. Tail long, rounded, fragile. Eye and lower eyelid well developed. Nostrils in the enlarged rostral plate, with a longitudinal slit behind. Limbs rudimentary or absent. The form of the body much resembles that of the common blind-worm of England, and they appear to have very similar habits. Their limbs, if present, are so rudimentary that they can give but little assistance in locomotion.

Acontias, *Cuvier*. Legs entirely absent. The type of this genus is a South African species; Kelaart, discovered in Ceylon a lizard which appears to belong to it.

Acontias (?) *layardi*, *Kelaart, Pr. Enum. Zeyl. ii. 12*.

Light olive and spotted longitudinally with brown spots, paler beneath. Length of young 4 inches. Cinnamon Gardens of Colombo.

Nessia, and *Evesia*, *Gray*. Four rudimentary legs. Rostral shield large, subconical, depressed, small, evidently burrowing reptiles, approaching the Rhinophides in habit and mode of life. They appear to be confined to the island of Ceylon, whilst the latter extend also over some parts of the neighbouring continent.

Nessia burtonii, *Gray, Ann. & Mag. Nat. Hist. ii. p. 336*. *Kelaart, Prodr. Faun. Zeyl. ii, p. 13*.

Grows to a length of 5 inches, the head

and trunk 3. Ceylon, Kaduganava and Allagalla (3,000 feet), and common at Ambegammoa.

Nessia monodactyla.

Evesia monodactyla, *Gray, l. c.*

E. bellii, *Dum. & Bibr. v. p. 783*.

Tetrapedon smithii, *Jan. in Wieg. Arch. 1860, p. 69. tab. 2. fig. 4*.

This species is similar to *N. burtonii*. The proportions of the body and tail are the same as in *N. burtonii*.

Family of Sand Lizards—Sepsidæ.

This family differs from those of the Skinks and of the Acontiads by the nostrils being in the front edge of a small shield, in a notch at the hinder side of the rostral. The species are African, extending over the warmer parts of Western Asia, one species reaches to Afghanistan.

Sphenocephala, *Blyth*. Limbs four, rudimentary, each with three toes. Ears invisible.

Sphenocephalus tridactylus, *Blyth, Journ. As. Soc. Beng. xxii. p. 654*.

A sepsoid form, allied to *Sphenops*, but with more slender and elongate shape, and the limbs placed more distinctly apart; the anterior minute, and fitting into a groove; the posterior as large as in *Sphenops*, and each having but three toes, of which the innermost and next are sub-equal, and the outer much shorter.

Family of Geckos—Geckotidæ.

Head broad triangular, more or less depressed; upper parts granular or tubercular; belly covered with small, rhombic, imbricate scales. Tongue rather thick and short, its basal portion being attached to the gullet. Eyelids generally rudimentary, and not connivent; pupil generally erect. Toes generally with an adhesive apparatus. The typical forms of this family may be recognized at first sight: the head is broad and depressed, with large eyes; the body is of moderate breadth; the tail thick at the base, tapering, generally somewhat deformed, as it easily breaks off and is as easily renewed. The limbs are stout, of moderate length, with at least four of the toes well developed. They are found in almost every part between and near the tropics, frequenting houses, rocks and trees; and some of the species are so numerous around and within human dwellings, that they are most familiar objects to the inhabitants. All the Indian species, with the exception of *Eublepharis*, are able to run up and along the surface of a wall or of any other perpendicular object: for this purpose the lower surface of their toes is provided with a series of moveable plates or discs, by the aid of which they adhere to the surface over which they pass. No Gecko has imbricate scales on the back,

brown. Iris rich golden brown. It attains to a length of 7 inches, of which the tail takes one-half. It is found chiefly in Java and in a few other islands of the East Indian Archipelago, Penang, Singapore, and the Island of Ramree appear to be the only places where it has hitherto been found in British India. The expansions of the skin have the same purpose as the wings of the Dragons and of the Flying Squirrels in leaping; in leaping these membranes are expanded by the pressure of the air from below and act as a parachute. When the Gecko is at rest, they are kept in close contact with the body by muscles attached to their inferior surface like other Geckos, they have in some degree the power of changing the ground-colour from a darker to a lighter shade.

Hemidactylus, Cuv. Fingers and toes dilated, ovate, with two series of transverse, imbricate plates beneath; thumb and inner toe with the ungual phalanx compressed and clawed, the claw sometimes being minute: sides of the trunk without cutaneous appendage, tail with the lateral edge not serrated. Species of *Hemidactylus* occur in almost every part of the tropical regions; the following are known from British India:—

Leiurus berdmorei, Blyth. A Gecko from Mergui, distinguished from *Hemidactylus* by having the tail rounded, not depressed, and without tubercles. It agrees with Mr. Gray's definition of *Leiurus*, except that there is no appearance of the toes being webbed at the base.

Hemidactylus triedrus.

Gecko triedrus, *Daud. Hist. Rept.* iv. p. 155. *Wolf, Abbild. merkw. naturh. Gegenst.* tab. 20. fig. 2.

Hemidactylus triedrus, Less. in Belan. Voy. Ind. Orient., Rept. p. 311. pl. 5. fig. 1. *Dum. & Bibr.* iii. p. 356. *Kelaart, Prodr. Faun. Zeyl.* i. p. 157.

On rocks and trees in Madras; coast of Malabar; rare in Ceylon; a few specimens at Trincomalee, where it is found in ant-hills; Kelaart never saw it in houses or on trees; it lays from three to six eggs, and attains to a length of 7 inches.

Hemidactylus subtriedrus, Jerd. Calc. Journ. As. Soc. Beng. xxii. p. 467, from the Nellore district in the Indian Peninsula, uncertain whether distinct from, or identical with, *H. triedrus*.

Hemidactylus maculatus. Dum. & Bibr. iii. p. 358. *Gray, Lizards*, p. 153. *Kelaart, Prodr. Faun. Zeyl.* i. p. 158.

Nubilia argentii, Gray, Lizards, p. 273.

? *Hemidactylus pieresii, Kelaart, l. c.* p. 159.

The most common species of the E. Indies; China, Lahore, Bengal, Singapore, Ceylon, the Anamallay Mountains. The Philippine Islands

and Mauritius. It is one of the commonhouse Geckos.

Hemidactylus sykesii. In the British Museum, is $7\frac{1}{2}$ inches long, and was brought by Colonel Sykes from the Deccan.

Hemidactylus frenatus. The Cheecha of Ceylon. *Dum. & Bibr.* iii. p. 366. *Kelaart, Prodr. Faun. Zeyl.* i. p. 161.

Ceylon, Penang, Singapore, Siam, Gamboja, Bengal and Assam, and according to Bibron Southern Africa, the East Indian Archipelago, and Polynesia. It scarcely ever exceeds the length of 4 to 5 inches; and is one of the most common house Geckos, seen soon after sunset in search of prey, which consists of flies and other insects. It does not reject boiled rice and crumbs of bread always returning to the spot where it has been thus before fed. It is also frequently met with on trees and on rocks. The female lays three or four eggs, in crevices of old walls or in the hollows of trees.

Hemidactylus leschenaultii. D. & B. iii. 354.

? *Hemidactylus leschenaultii, Jerd. Calc. Journ. As. Soc. Beng.* xxii. p. 468.

Very similar to *H. frenatus*, with which it agrees in the structure, size, and number of the scales and tubercles.

Hemidactylus punctatus. Jerd. Calc. Journ. As. Soc. Beng. xxii. p. 467. Back with some larger conical scales, and subcaudal scutes very large. Tellicherry.

Hemidactylus coctæi. Dum. & Bibr. iii. (1836) p. 365. *Cantor, Mal. Rept.* p. 23.

Boltalia sublævis, Gray, Zool. Misc. 1842, p. 58, *Kelaart, Prodr. Faun. Zeyl.* ii. p. 18.

Patna, Penang, Ceylon. Length 6 or 7 inches. Living on trees and on roofs of houses. Kelaart (*Prodr. Faun. Zeyl.* i. p. 160) mentions a *Hemidactylus coctæi* as a species distinct from *Boltalia sublævis*; Gunther has not been able to indentify this *H. coctæi* of Kelaart.

Peripia, Gray. Fingers and toes dilated, ovate, with two series of transverse, imbricate plates beneath; thumb and inner toe without ungual phalanx; clawless: claws 4—4. Sides of the trunk, without cutaneous appendage.

Peripia peronii.

Hemidactylus peronii, Dum. & Bibr. iii. p. 351. pl. 30. fig. 2. *Cantor, Catal. Mal. Rept.* p. 22. *Kelaart, Prodr. Faun. Zeyl.* i. p. 187.

Back uniform granular, without any tubercles. This species, which attains to a length of from 4 to 5 inches, was first described from specimens from the Isle of France, and has been found by Cantor in houses in the valley of Penang, and by Kelaart at Kaduganava, Ceylon, where it frequents trees.

Peripia cantoris.

Platydaetylus lugubris, Cantor, *Mal. Rept.* p. 16 (not *Dum. & Bibr.*)

Hemidaetylus peronii, *D. & B. of Cantor.*

Back uniform granular, without any tubercles from Penang. It is 3 inches long.

Nycteridium, the *Platyurus* of Gray. Fingers and toes dilated, ovate, with two series of transverse, imbricate plates beneath; thumb and inner toe with a compressed ungual phalanx and with a claw. Sides of the trunk with a cutaneous expansion. Tail flattened, serrated on the sides. It is a modified form of *Hemidaetylus*, to which it stands in the same relation as *Ptychozoon* to *Gecko*. Only one species is known.

Nycteridium schneideri.

Stellio platyurus, *Schneid. Denkschr. Acad. Wiss. Munch.* 1811, tab. 1. fig. 3.

Lacerta schneideriana, *Shaw, Zool.* iii. p. 278.

Hemidaetylus platyurus, *Wiegman. Act. Ac. Leop. Carol. Nat. Cur.* xvii. p. 288.

H. marginatus, *Wiegman. Amph.* p. 145. *Dum. & Bibr.* iii. p. 370. pl. 30. fig. 2 (not good).

Platyurus schneiderianus, *Gray, Lizards*, p. 157.

This species is found throughout the East Indian Archipelago, in Assam and Bengal; it is common in Siam and at Penang. Kelaart has sent two specimens from Ceylon. It attains to a length of $4\frac{1}{2}$ inches.

Phelsuma, *Gray*. Fingers and toes free, rather elongate, with the base rather slender and with the extremity dilated, ovate below, provided with undivided, imbricate, transverse plates; claws none.

Phelsuma andamanense. *Blyth, Journ. As. Soc. Beng.* xxix. p. 108. Andaman Islands. Head and body 2 inches, tail (renewed) $1\frac{1}{2}$ inch.

Gymnodactylus, *Spix*. Each finger and toe is composed of two portions; a basal portion, depressed, and provided with a series of transverse plates beneath; and a terminal portion formed by two compressed, more or less slender phalanges; claws five to each foot, free, without sheath. Tail cylindrical, tapering.

Gymnodactylus triedrus. Ceylon. Nearly 4 inches long.

Gymnodactylus pulchellus. *Wagl. Amph.* p. 144. *Cantor, Catal. Mal. Rept.* p. 25.

Cyrtodactylus pulchellus, *Gray, Phil. Mag.* ii. p. 56, and *Ind. Zool., Rept.* tab.

Found in elevated parts near Penang and Singapore, and attains to a length of 10 inches. Its habits are similar to those of other *Geckos*; it bites fiercely in defence; in captivity it refuses insects. The integuments, when about being renewed, are torn off piecemeal by the teeth and devoured; egg of a spherical form about half an inch in diameter, of a whitish-yellow colour.

Gymnodactylus fraenatus. A fine species found in Ceylon; it attains to a length of 7 inches.

Gymnodactylus kandianus. *Kelaart, Prodr. Faun. Zeyl.* i. p. 52. A small diurnal species, 3 inches long, and very abundant on every house in Kandy and Kaduganava.

Gymnodactylus mysoriensis. *Jerdon, Journ. As. Soc. Beng.* xxii. p. 469.

Bangalore, frequenting rocks and also entering out-houses.

Gymnodactylus indicus. *Gray, Ann. & Mag. Nat. Hist.* 1846, xviii. p. 429. *Jerdon, Journ. As. Soc. Beng.* xxii. p. 469. A small species from the Neilgherries, three inches long. It conceals itself under stones in the day time; yet it has the pupil of the eye round. He procured it on the top of Dodabetta, the highest mountain of the group, and has also found it in Coorg. Its colours, when fresh, are of a mottled brown, or greenish brown, with a row of yellow spots along the back, edged with darker, and a series of similarly coloured spots on each side.

a. *G. malabaricus*, *Jerd.* l. c. p. 469.—Dark brown above, marbled with black spots, and a white spot on the nape. $2\frac{1}{2}$ inches long. Forest of Malabar.

b. *G. littoralis*, *Jerd.* l. c.—Very slender; pale brown, with a series of paler marks along the back tail; a black spot on the nape. $2\frac{1}{4}$ inches long. Sea-coast of Malabar.

Gymnodactylus deccanensis, *Sykes*, a pretty species of the Deccan.

Pentadactylus duvancelii. *Dum. & Bibr.* iii. p. 312. *Gray, Lizards*, p. 160.

Described by Bibron said to have been brought from Bengal. 10 inches long, the tail measuring $5\frac{1}{2}$ inches.

Puellula, *Blyth*. Toes not dilated, but distinctly ribbed, except on the ungual phalanges. A distinct rudimentary dorsal crest. No femoral or præanal pores, but a large, raised glandular space at the base of the thighs underneath divided by a slight median groove on the anterior half, which deepens to form a large glandular cavity on the posterior half. This structure is less developed in the female.

Puellula rubida, *Blyth, Journ. As. Soc. Beng.* xxix. p. 109. Length about 5 inches, of which the tail is half. A common species at Port Blair Andaman Islands.

Eublepharis, *Gray*. Fingers and toes not dilated or depressed, rather short, all clawed, and with a single series of simple, transverse, narrow scales below. The upper eyelid broad, prominent, the lower well developed. Tail cylindrical, tapering.

Eublepharis hardwickii, *Gray, Zool. Journ.* iii. p. 323. This attains to a length of from 8 to 9 inches. Chittagong, Russelconda, Annamly Mountains, also found at Waltair, suburb of Vizagapatam.

Family of Agames.—Agamidae.

Head covered with numerous, very small flattish or convex shields. Tongue thick, attached to the gullet along its whole base, not or but slightly, notched in front. Scales of the back, sides, and belly imbricate, generally rhombic. Tail long, tapering, not fragile. Eye and eyelids well developed; pupil round. Nostrils in a separate plate. Teeth implanted on the edge of the bones of the jaws; generally a pair of canine teeth in front of each jaw. Limbs well developed. The Agames are Land Lizards spread over almost every part of the Old World and of Australia, being much less numerous in the temperate parts than in the tropical—some, with a compressed body and with a long, more or less compressed tail, live on trees or bushes, whilst others, with a depressed body and with a shorter tail, inhabit rocks or plains. The most slender and the most gaily-coloured forms belong to the former division, the heavier ones with duller colours to the latter. They do not attain to any considerable size, and none of the Indian species exceed a foot in length, the tail not included. The greater part are insectivorous, but many feed on vegetables (seeds, fruits, leaves) as well as on animals. All are oviparous. The species of the E. Indies belong to the following genera.

Draco, *Linn.* A semi-circular membrane, supported by the five or six posterior (false) ribs, which are much prolonged, forms a sort of wing or parachute on each side of the body. A vertical appendage is suspended from the middle of the throat; a smaller horizontal fold of the skin on each side of the gular appendage. The Dragons are entirely confined to the East Indies; they are more numerous in the Archipelago than on the continent, they have not yet been found in Ceylon. The character by which they are at once recognized is the peculiar additional apparatus for locomotion formed by the much-prolonged five or six hind ribs, which are connected by a broad expansible fold of the skin, the whole forming a sub-semicircular wing on each side of the body. The Dragons are Tree Lizards, and, jumping from branch to branch, they are supported in the air by their expanded parachutes, which are laid backwards at the sides of the animal while it is sitting or merely running. If the hind extremities of a Dragon were cut off, it would lie helpless on the ground; but it would still move with great velocity if

it were merely deprived of its wings. The locomotion of the Dragons is a series of leaps, and not a continuous running; they are the Anoles of the Old World. The transcendent beauty of their colours baffles description. As the lizard lies in shade along the trunk of a tree, its colours, at a distance, appear like a mixture of brown and grey, and render it scarcely distinguishable from the bark. Thus it remains with no signs of life except the restless eyes, watching passing insects, which, suddenly expanding its wings, it seizes with a sometimes considerable unerring leap. The lizard itself appears to possess no power of changing its colours. Almost all the species attain to the same length, viz. 7—8 inches, of which the tail takes one-half or rather more than one-half. *D. quinquefasciatus* appears to be somewhat larger than the others.

Draco volans et præpos, *L. Syst. Nat.* xii. p. 358.

D. viridis et fuscus, *Daud. Rept.* iii. pp. 301, 307.

D. daudini, *Dum. & Bibr.* iv. p. 451.

D. viridis, *Schleg. Abbild.* p. 89. tab. 24. fig. 1.

D. volans, *Cantor, Mal. Rept.* p. 37.

Throat and sides of the gular appendage with numerous brown dots. The colours vary much, not only according to the localities, but also individually; the brown or black dots on the throat appear to be constant. Head metallic brown or green, with a black spot between the eyes. This species is found in Java, Sumatra, Borneo, Penang and Singapore.

Draco reticulatus (n. sp.) from the Philippine Islands, and *Draco cornutus* (n. sp.) from Borneo, are allied to *D. volans*.

Draco maculatus, *Cantor, Mal. Rept.* p. 39.

Dracunculius maculatus, *Gray, Lizards*, p. 236.

Found in different parts of the coast of Siam, at Penang, and in Tenasserim.

Draco dussumieri, *Dum. & Bibr.* iv. p. 459. *Jerdon, J. As. Soc. Beng.* xxii. p. 474.

Found in the neighbourhood of forests of the west coast of the Peninsula of India, frequenting the cocoanut and betel-nut plantations in their vicinity. It is tolerably common in all Malabar, Cochin, and Travancore, but not known farther north than Malabar, being either unknown or very rare in Canara.

Draco quinquefasciatus, *Gray, Zool. Journ.* 1827, p. 289; *Ind. Zool.* c. fig. It is said to be from Penang, 8 inches long, the tail measuring 4.

Draco tæniopterus, *Guth. Proc. Zool. Soc.* 1861. April 23, p. 187. Chartaboum, on the coast of Siam; the coast of Tenasserim.

Draco bimaculatus.—Philippine Islands.

Draco rostratus.—Probably from Borneo.

Otocryptis, *Wieg. Tympanum* hidden. Back

and sides covered with small scales, which are regularly arranged ; a few large ones scattered over the sides. Male with a low nuchal crest and with a large gular sac ; no dorsal crest. Head without any prominent spines or appendages. Limbs exceedingly long ; hind limb longer than the body. Scales on the lower part of the tail not elongate. Only one species is known.

Otocryptis bivittata, *Wieg.* *Isis*, 1832, p. 291. The limbs are exceedingly long, the hind limb extending far beyond the extremity of the snout, if laid forwards ; the fourth hind toe is nearly twice as long as the third. Brownish olive ; male generally with a whitish band along each side of the back ; six or seven brown cross bars on the middle of the back between the bands ; legs and tail with brownish transverse bands. Though local, does not appear to be scarce in Ceylon. At Trincomalee, Hinida, Ratnapura, and on Adam's Peak. An adult male measures 10 inches, the tail measuring 7 ; the length of its hind leg is $3\frac{1}{2}$ inches.

Lyriocephalus, *Merr.* Tympanum hidden. Back and sides covered with minute scales ; several distant series of large scales along the trunk ; a crest runs along the whole vertebral line ; superciliary margins pointed behind. Gular appendage moderately developed. The adult with a globular hump on the nose. Only one species is known.

Lyriocephalus scutatus. *Walg. Amph.* p. 150. *Kelaart. Faun. Prodr. Zeyl.* i. p. 166.

Lacerta scutata, *L. Syst. Nat.* i. p. 360.

Lyriocephalus margaritaceus, *Merr. Amph.* p. 49.

L. macgregorii, *Gray, Ind. Zool.* c. fig.

Nearly uniform dark green above, paler below. This species is a native of Ceylon. It attains to the length of 15 inches, of which the tail takes one-half. The female lays from three to four hard shelled eggs of about the size of sparrows' eggs.

Ceratophora, *Gray.* Tympanum hidden. Scales of the upper parts of the trunk unequal in size ; anterior part of the back with a rudimentary, or without any crest ; superciliary margins not pointed behind. Gular sac not developed or absent. A pointed or scaly appendage on the nose, at least in the male sex. The *Lyriocephalus* and *Ceratophora* lizards come from the interior of Ceylon and the two genera should perhaps be united.

Ceratophona stoddartii, *Gray, Ind. Zool.* c. fig. *Kelaart, Prodr. Faun. Zeyl.* i. p. 165. Dark green, with dark-brown cross bands across the back, tail, and limbs ; generally a whitish streak behind the orbit. The horn on the snout is more developed in the adult males than in the females and in the

young ; it is half an inch long in the former, whilst it is reduced to half that length in the females.

Ceratophora tennentii, *Gunth. in Tennent, Nat. His. Ceyl.* p. 281. The appendage on the nose is fleshy. Green, irregularly marbled with brownish. An inhabitant of Ceylon.

Ceratophora aspera. Brownish, marbled with darker ; a rhombic light colour spot on the sacral region.

Cophotis, *Peters.* Tympanum hidden. Back and sides covered with very large, imbricate, regular scales subequal in size. A nuchal and dorsal crest. A small gular sac in both sexes. Male with only a very small tubercle behind the rostral shield. One Ceylon species.

Cophotis ceylanica, *Peters, Monatsber. Acad.* Dec. 1861, p. 1103. Very locally distributed in Ceylon, evidently a tree Lizard.

Japalura et *Biancia*, *Gray.* Tympanum hidden. The upper parts covered with small, imbricate, keeled scales between which larger ones are intermixed ; dorsal crest low. Tail slightly compressed at its base. Throat with a small pouch in the male, and with a transverse fold. No rostral appendage. Ventral scales of moderate size, keeled ; scales below the tail as broad as long. Found in the Himalaya, a second on the island of Formosa, and a third in one of the Loochoo Islands.

Japalura variegata. *Gray.*

Biancia niger, *Gray, in Ann. & Mag. Nat. Hist.* xii. 1853, p. 387.

Sikkim ; the colours vary to a considerable extent. A large female is almost wholly black above, variegated with yellow, all the larger scales being of the latter colour. The characteristic bands on the head and side of the neck are present ; it attains to a length of 12 inches, the tail taking two-thirds of it.

Japalura swinhonis. Formosa, 8 inches long, the tail $5\frac{1}{2}$ inches.

Japalura polygonata.

Diploderma polygonatum, *Hallowell, Proc. Acad. Nat. Sc. Philad.* 1860, p. 490.

Amakarima Island (Loochoo) ; uniform greenish olive above ; eight dark-coloured bands on the tail ; seven upper labials ; no fold across the chest ; neck slightly folded, it is 7 inches 9 lines long, the tail measuring $5\frac{1}{2}$ inches.

Sitana, *Cuv.* Limbs long, with five toes in front and with only four behind. Scales regularly arranged, keeled. Tympanum visible. Scarcely any crest on the neck ; male with a very large gular appendage which can be folded up like a fan. Femoral pores none, an easily distinguished genus, having only four toes behind. *Sitana* is confined to Western India and to Ceylon ; only two species are known.

Sitana ponticeriana, *Cuv. Règne, Anim. Dum. & Bibr. iv. p. 437.*

Gular appendage tri-coloured—blue, black, and red, length 8 inches, of which the tail 6 inches, inhabits northern parts of India.

Sitana minor.

Sitana ponticeriana, *Jerd. Journ. As. Soc. Beng. xxii. p. 473 (not Cuv.)*

Easily distinguished by its proportionally much longer limbs; found in the neighbourhood of Madras, where it appears to be common in fields and low copses, avoiding wooded districts. The gular appendage is equally developed in both species. The splendid colours of this appendage are only exhibited during the pairing season. It is the common prey of many rapitorial birds.

Sitana ponticerianus, *Keluart, Prodrom. Faun. Zeyl. p. 164.* Ceylon; probably identical with the Madras species.

Dilophyrus, *Gray*. Tympanum naked. Back and sides covered with equally minute granular scales; a very high nuchal and dorsal crest, the lobes of the crest being united by a membrane. Gular sac small. Tail compressed.

Dilophyrus grandis, *Gray, Lizards, p. 230. Cantor, Mal. Rept. p. 34, pl. 20.* Rangoon, Penang. 22½ inches long, tail 16 inches, one was captured by Sir William Norris on the Penang hills, on the bank of a mountain stream, at an elevation of 2,000 feet. It appeared slow in its movements and of general sluggish habits.

Bronchocela, *Kaup*. Tympanum naked. Back and sides covered with scales equal in size and regularly arranged, the tips of those on the sides being directed backwards and downwards. Head without appendages or prominent spines. Dorsal crest present, formed by non-united spines. Gular sac but slightly developed. Tail not compressed, the scales on its lower side being as broad as long. Femoral pores none. The species are true tree lizards, of a more or less pure green colour; they are found chiefly in the Archipelago, but extend to the southern coasts of the continent, and several of the species are the most common lizard of the East Indies: they are not found in Ceylon. Three species are known to occur on the Indian continent:—

Bronchocela cristatella. The Gruning.

Agama cristatella, *Kuhl, Beitr. Zool. p. 30.*

A. gutturosa, *Merr. Amph. p. 51.*

A. moluccana, *Less. Voy. Coq. Rept. pl. 1. fig. 2.*

Bronchocela cristatella, *Dum. & Bibr. iv. p. 395. Cantor, Mal. Rept. p. 30.*

Very common in the Malayan countries and in the Eastern Archipelago, Sumatra, Java, Amboyna, Celebes, Borneo, Booroo, Philippines, &c. It moves and leaps with great quick-

ness among the branches of trees. The colours change suddenly to grey, brownish or blackish, sometimes with orange spots or with indistinct black network; large, isolated, round black spots appeared on the head or back or round the tympanum. It attains to a length of 20 inches, the tail measuring 16 inches.

Bronchocela smaragdina. Above uniform beautiful emerald-green, below greenish white; both colours are separated by a yellow band, running along each side of the belly, extending over the hind part of the femur, and lost behind the root of the tail. Gamboja; 16½ inches long, the tail measuring 13 inches.

Bronchocela jubata, *Dum. & Bibr. iv. p. 397.*

B. gutturosa, *Gray, Lizards, p. 241 (not Merr.)*

Common in Java; occurs also in Pondicherry. It attains to a length of 21 inches, the tail measuring 16 inches.

Calotes, *sp., Cuvier*. Tympanum naked. Back and sides covered with scales equal in size and regularly arranged, the tips of those on the sides being directed backwards and upwards. Dorsal crest present, formed by non-united spines. Gular sac but slightly developed. Subcaudal scales as broad as long. Femoral pores none.

The species of *Calotes* are closely allied to *Bronchocela*; but whilst the latter are almost entirely confined to the Archipelago, the *Calotes* are found only on the continent, including Ceylon. As far as our present knowledge extends, the coast of Siam is the only country where both genera intermingle with each other. The chief structural difference between both is in the direction of the scales. They are true tree lizards, some having the tail rather compressed at the base. They feed on insects, on tender leaves, and on berries.

Calotes versicolor. The blood sucker.

Agama versicolor, *Daud. Rept. iii. p. 395. t. 44. A. tiedemanni, Kuhl. Beitr. Zool. p. 109. Kaup. Isis, 1827, p. 619. t. 8.*

A. vultuosa, *Hart. Journ. Acad. Nat. Sc. Philad. v. p. 296. t. 19.*

Calotes versicolor, *Dum. & Bibr. iv. p. 495. Gray, Lizards, p. 243. Keluart, Prodr. Faun. Zeyl. p. 170. Blyth, Journ. As. Soc. Beng., xxii. p. 449. Jerdon, ibid., p. 470.*

C. viridis, *Gray, Ann. & Mag. Nat. Hist. 1846, xviii. p. 429 (not Jerdon or Blyth).*

C. rouxi, *Blyth, l. c. xxi. p. 354, not D. & B.*

The ground-colour is generally a light brownish olive, but the lizard can change it to bright red, to black, and to a mixture of both. This change is sometimes confined to the head, at other times diffused over the whole body and tail. The bright changeable colours are peculiar to the male during the breeding-season, in the months of May and June, and it then may be seen seated on a hedge or bush, with the tail and limbs black, head and

neck yellow picked out with red, and the rest of the body red.

This is one of the most common lizards, extending from Afghanistan over the whole continent of India to China; it is very common in Ceylon, not extending into the temperate zone of the Himalaya. Ceylonese specimens are generally somewhat larger; one of them measured 16 inches, the tail taking 11 inches. It is found in hedges and trees; the origin of the name of "bloodsucker," cannot be traced; in the opinion of Kelaart the name was given from the occasional reddish hue of the throat and neck. It frequently raises and lowers its body and head, from which mahomedans hate it, as they say it imitates their attitudes in prayer.

Calotes nemoricola, *Jerd. J. B. S.* xxii. p. 471. Green obtained near the foot of the Coonoor ghat of the Neilgherries. 18 inches long.

Calotes mystaceus, *Dum. & Bibr.* iv. p. 408, *Blyth in Kelaart, Prodr. Zeyl.* i. App. p. 47.

Green, clouded with yellowish; a series of large round purplish-brown spots along each side of the back. Burmah, Pegu, Siam, Mergui, Gambouja and Ceylon. An old male measures nearly 24 inches, the tail taking 19 inches.

Calotes rouxii, *Dum. & Bibr.* iv. p. 407. C. Elliott, *Gunth.* Brownish, uniform or spotted with black. Mr. Blyth has a C. rouxi from Burmah and Ceylon; but this determination and that by Mr. Jerdon are incorrect. The lizard in question having a row of three or four spines above the tympanum. See C. uigrilabris.

Calotes ophiomachus.

Lacerta calotes, *L. Syst. Nat.* i. p. 367.

Agama ophiomachus, *Mirr. Amph.* p. 51.

Calotes ophiomachus, *Gray, Syn. Rept. in Griff. Anim. Kingd.* ix. p. 55. *Dum. & Bibr.* iv. p. 402. *Kelaart, Prodr. Faun. Zeyl.* i. p. 169. *Tennent, Nat. Hist. Ceyl.* p. 276.

? *Calotes viridis*, *Kelaart, l. c.* p. 171 (not Gray.)

Ceylon and the neighbouring parts of Southern India, also found in the Nicobar Islands. It attains to a length of 26 inches, the tail being four times as long as the body.

Calotes platyceps, *Blyth in Kelaart; Prodr. Faun. Zeyl.* i. App. p. 56.—No black stripe through the eye.—Cherra Punji.

Calotes nigrilabris. *Peters, in Monatsber. Acad.* 1260, p. 133.

Calotes rouxii, *Blyth in Journ. As. Soc. Beng.* xxii. p. 647, (not *Dum. & Bibr.*)

The ground-colour is beautiful green, but the ornamental colours vary,—not very rare in Ceylon; it is found in the environs of Newera Ellia. Blyth gave a good description of varieties *a* and *b*, but mistook it for C. rouxii.

Calotes emma, *Gray, Lizards*, p. 244. *Blyth. Journ. As. Soc. Beng.* xxii. p. 647.

Mergui, Schwe-Gyen on the Sitang river, in Pegu, ranging northwards perhaps to the Khasya Hills; Afghanistan? Length 12 inches, the tail 8 inches.

Calotesmaria, *Gray, Lizards*, p. 248.

? *Calotes tricarínatus*, *Blyth, Journ. As. Soc. Beng.* xxii. p. 650.

Specimens from Khasya Hills from Jamu, Himalaya, where it is found at an elevation of about 3,000 feet. Afghanistan doubtful. Length 16 inches, the tail 12.

Salea, *Gray.* Tympanum naked. Back and sides covered with strongly keeled scales of moderate size; several larger scales are intermixed with the others on the side; the scales from longitudinal series, and their tips are directed backwards; head without any spines. A crest on the back; gular sac none. Tail slightly compressed at the base, with keeled scales below, which are almost as broad as long. Only one species is known.

Salea horsfieldii, *Gray, Lizards*, p. 242. (female.)

S. jerdonii, *Gray, Ann. & Mag. Nat. Hist.* xviii. 1846, p. 429 (male.) *Jerdon, Journ. As. Soc. Beng.* xxii. p. 473. *Kelaart, Prodr. Faun. Zeyl.* p. 167.

Mecolepsis trispinosus, *Duméril, Arch. Mus. Hist. Nat.* viii. 1856, p. 564. pl. 24. fig. 1. (adult male = *S. jerdonii*, *Gray*.)

M. hirsutus, *Duméril, l. c.* fig. 2 (immature male)
M. sulcatus, *Duméril, l. c.* fig. (female = *S. horsfield*.)

The coloration appears to be very variable: Jerdon describes it as a bright grass-green marbled with brown, with some red marks on the head and nape and with a few white scales on the sides. The colours become darker at a lower temperature, as is the case with many tropical lizards. This is the only species known, the *S. gularis* of Blyth evidently belonging to a different genus. It is found in the Neilgherries and at Newera Ellia in Ceylon, where it frequents bushes and hedges.

Oriocalotes. Tympanum naked. Back and sides covered with scales of moderate size between which larger ones are intermixed; their tips are directed backwards and upwards; a spine behind the superciliary edge. Dorsal crest present, formed by non-united spines, less distinct in the female than in the male. Gular sac none. Tail rounded, with keeled scales below, which are as broad as long. Only one species is known.

Oriolates minor. *Gray. Calotes minor*, *Gray.*

Greyish olive, marbled with brown, the brown spots being sometimes bandlike between the eyes, on the limbs, and across the base of the tail. Brown streaks radiate from the orbit. Afghanistan? Khasya, Sikkim. Length 7 inches, the tail taking 4½ inches.

Acanthosaura, Gray. Tympanum naked. Back and side covered with very small scales, between which, generally, larger keeled ones are scattered; a free spine behind the superciliary edge. Dorsal crest present, formed by non-united spines. Gular sac none. Tail slightly compressed at the base, with keeled scales below, which are longer than broad.

Acanthosaura armata, Gray, *Lizards*, p. 240. *Agama armata*, Gray, *Zool. Journ.* 1827, iii. p. 216. *Liphurus armatus*, Dum. & Bibr. iv. p. 413. *Cantor, Mal. Rept.* p. 32.

Singapore, Penang, on the coasts of Tenasserim and Siam (Chartaboum), and in Cochin-China, numerous. 12½ inches long, the tail taking 7. Very active and fierce, possess in a slight degree the power of changing the ground-colour. In a female were found thirteen eggs, of an oval shape, ⅓rds of an inch long. The stomach contained fragments of leaves and twigs.

Acanthosaura capra, Gunth. *Proc. Zool. Soc.* 1861, April 23, p. 188. Chartaboum, on the coast of Siam; the larger is 13 inches long, the tail measuring 8; the other is only half that size, and has the postorbital spine and the nuchal crest well developed, though comparatively lower.

Acanthosaura coronata, Gunth. *Proc. Zool. Soc.* 1861, April 23, p. 187. Chartaboum together with *A. armata* and *A. capra*. An adult pregnant female is 7 inches long, of which one-half is taken by the tail.

Orioliaris.—Tympanum naked. Back and sides covered with very small scales, between which larger keeled ones are scattered; a tubercle behind the superciliary edge. Dorsal crest very low, formed by a series of larger, keeled, not prominent scales. Gular sac none. Tail not compressed, with keeled scales below, which are almost as broad as long. Only one species is known.

Orioliaris elliotti, Gunth. *Proc. Zool. Soc.* 1860, p. 151, pl. 25. fig. B.

The ground-colour of the upper parts is brownish; uniform in the females, variegated with darker in the males. Some of the large scales of the back appear to have been iridescent during life. The lower parts are uniform dull yellowish. Length nearly 7 inches, the tail 4½. Sikkim parts of the Himalaya, its up to 9,200 feet.

TIARIS.

Tiaris, D. & B. Gray *Lizards*, p. 230.

Tympanum naked. Back and sides covered with small imbricate scales with scattered larger ones: no spine behind the superciliary margin. Dorsal crest present, formed by non-united spines; gular sac present, at least in

the males. A fold before the shoulder. Femoral pores none.

Tiara subscristata, Blyth, J. A. S. *Beng.* xxix. p. 100. Colours various; length 8½ inches. Port Blair, other species occur in N. Guinea and the Philippine Islands.

Physignathus, Tympanum naked; the upper parts covered with minute granular scales of equal size, arranged in transverse series; throat tubercular; ventral scales smooth; head without any spines. A crest on the back and tail; a fold across the throat. Tail compressed, covered with keeled scales, those at its lower side rather broader than long, strongly keeled. A series of pores on the inner side of the femur. The species of this genus attain to a larger size than the other Indian *Agamidae*, and approach the *Iguanidae* in general habit. Nothing is known of their habits. Only two species are known:—

Physignathus cochinchinensis. Cuv. *Régne Anim.*

Lophura enveri, Gray, in *Griff. Anim. Kingd.* ix. *Syn. Rept.* p. 60.

L. concinna, Gray, l. c. p. 61.

Istiurus physignathus, Dum. & Bibr. iv. p. 387.

Greenish olive: tail with brown cross bands. from Cochin china. 28 inches long, tail above 17 inches.

Physignathus mentager.

Dilophyrus mentager, Gunth. *Proc. Zool. Soc.* 1861, p. 188.

Green: tail with brown cross bands from Chartaboum, on the coast of Siam; it is stuffed, 30 inches long, the tail measuring 21 inches.

Lirolepis, Cuv. Tympanum naked; the upper parts covered with minute granular scales of equal size; tail depressed, with very small, square, keeled scales arranged in transverse series; throat with two transverse folds; no dorsal crest; ventral scales small, smooth. Femoral pores. Skin of the sides of the trunk very lax, capable of being expanded into a sort of wing, supported by the very long anterior spurious ribs. Only one species is known.

Lirolepis guttatus. Cuv. *Regne Anim. Dum.* §. *Bibr.* iv. p. 465. pl. 43. fig. 1.

Uromastix belliana, Gray, *Ind. Zool. c. fig.*

Lirolepis reevesii, Gray, *Lizards*, p. 263. *Cantor, Mal. Rept.* p. 44.

L. bellii, Gray, *Lizards*, p. 263. *Cantor, Mal. Rept.* p. 41.

Blackish grey above, with series of yellow, black edged spots; some of the spots are confluent, entirely black, forming irregular longitudinal bands: in Chinese specimens the spots are not confluent, forming regular ocelli (*L. reevesii*). Throat pale azure; belly pale orange, reticulated with blue; lower eyelid

pure white. It has an expansible wing membrane, which in a state of repose appears like a longitudinal loose fold; expanded, the external margin becomes arched, the trunk and the membranes forming a greatly flattened oval disk, resembling the hood of *Naja*. Malayan Peninsula, Mergui, Gamboja, and China. 19 inches, tail 13 inches.

Uromastix, Merrem. Tympanum naked; the upper parts covered with minute granular scales of equal size; tail depressed, surrounded by rings of spinous tubercles, not extending on its lower side; throat with a transverse fold; no dorsal crest; ventral scales small, smooth. Femoral and præanal pores. One species is known from India.

Uromastix hardwickii. Gray, *Zool. Journ.* iii. p. 219; *Illustr. Ind. Zool. c. tab.*

U. reticulatus, Cuv. Regne Anim.

Saura hardwickii, Gray, Lizards, p. 262.

Lighter or darker yellowish grey, or greyish olive, uniform, or clouded, or with waved blackish transverse lines; sometimes a large black spot on the inner side of the femur. The plains of Hindostan; Kanouj, Kurrachee, Goojerat: not found in Bengal. Length 13 inches, the tail $5\frac{1}{4}$ inches.

Charasia, Gray. Tympanum naked. Body depressed, covered with small, imbricate, keeled scales equal in size, and regularly arranged in transverse series: tail slightly compressed, with cross rows of small, keeled scales; those at its lower side small, truncated. Throat with a cross fold; no gular sac; a low dorsal crest; ventral scales small, smooth. Femoral or præanal pores none.

Charasia dorsalis, Gray, Syn. Rept. in Griff. Anim. Kingd. p. 56. *Dum. & Bibr.* iv. p. 486. *Jerdon. Journ. As. Soc. Beng.* xxii. p. 475. *Gray. Lizards, p. 246.*

The colour is brownish yellow or dusky grey on the back; a black band commences behind the eye, and another behind the angle of the mouth; the former is continued on, and spreads over the sides of the body; legs dotted with black. The male is sometimes of a brighter colour—red or yellow on the back, black on the sides and on the belly. This rock lizard, is partially distributed in Southern India, and only found at some elevation above the sea. It is most abundant in Mysore, and especially in the neighbourhood of Bangalore, where it may be seen on every bare rock.

It is not uncommon also on the edges of the Neilgherries up to the height of nearly 6,000 feet. Specimens from Pind Dadun Khan. Length from 15 to 16 inches, of which the tail takes 11 inches.

Stellio, Daud. Tympanum naked. Body depressed, covered above and laterally with scales unequal in size and shape: tail rounded-tapering, surrounded by rings of more or less prominent spinous scales. Throat with a cross fold; no gular sac; nuchal crest none or rudimentary; ventral scales small, smooth; femoral and præanal pores none. The *Stellio* lizards have no true præanal pores; but the epidermis of all the scales in the præanal region becomes thickened, callous, and of a brown colour in the males during the breeding-season. Only one species is known.

Stellio tuberculatus.

Agama tuberculata, Gray, Ill. Ind. Zool. Dum. & Bibr. iv. p. 488.

Laudakia tuberculata, Gray, Lizards, p. 254.

? *Stellio indicus, Blyth, Journ. As. Soc. Beng.* xxii. p. 646.

Barycephalus aykesii, Gunth. Proc. Zool. Soc. 1860, p. 150. pl. 25. fig. A.

Rostral shield is low, twice as broad as high: twelve upper labials. Ground-colour of the upper part is a dusky brown, the back being irregularly speckled with black; two of the specimens exhibit also some lighter indistinct spots; the lower parts are whitish; the throat is reticulated, with greenish; one specimen has the breast dotted with bluish green.

Simla, Tibet, to an elevation of 15,000 feet, Upper Hindostan Mirzapore, Wuzerabad. Length 11 or 12 inches, the tail 7 or 8 inches.

Trapelus. (Cuv.) Gray, Lizards, p. 258. Tympanum naked. Body depressed, covered with irregular scales unequal in size; tail rounded, tapering, covered with imbricate keeled scales, not arranged in rings; head and neck without spines. Throat with a cross fold; nuchal crest none, or rudimentary; a series of anal pores in the male. This North-African genus, extending into Western Asia.

Trapelus megalonyx. Greyish, marbled with brown; a series of six ocellated white spots, edged with blackish, along the vertebral line. $5\frac{1}{2}$ inches long, the tail measuring 3 inches. Afghanistan, and not from Khasya.

Phrynocephalus. *Kaup.* Head very short, depressed, closely rounded in front: tympanum hidden: no dorsal crest whatever.

Phrynocephalus tickelli, Gray. Ph. Olivieri D. & B.

Afghanistan, length 4 inches, tail $2\frac{1}{2}$ inches, tail with alternate broad whitish and blackish rings.

Phrynocephalus candivolvulus, Wagler, Ercht. D. & B.

Phryn. tichellii, Gunth.

Lacerta candivolvula. *Pall. Z. B.*

Agama and *Cellata*. *L. in Evera. Rees.*

Tibet : Tartary, Central Asia. Length 4 in. tail $2\frac{1}{2}$ inch. Greyish olive marbled with blackish spots on each side of tail.

Brachysaura ornata, *Blyth. J. S. Beng. xxv.* 1856, p. 4+8. Saugor, an enormous head, short and thick body olive colour : a conspicuous oblique white band passing from beneath the eye, to the angle of the mouth.

Family of Chameleons—Chamæleonidæ.

Head large, angular, covered with numerous very small, flattish or convex shields; body compressed, covered with granular scales above and below; tail long and prehensile. Tongue exceedingly long, worm-like, club-shaped and viscous in front, very extensible. Eyes globular, very mobile, covered with a circular lid which is pierced with a small central hole. Tympanum hidden. Legs thin, each with five toes, formed into two grasping opposable groups. Africa, is inhabited by numerous species; they extend to the northern shores of the Mediterranean and into South-western Asia, into Hindostan and Northern Ceylon. The inflexibility of the neck is compensated by the wonderful structure of the eyes, which are so prominent that more than one-half of the ball stands out of the head; and not only can they be moved in any direction, but each has an action independent of the other: one eye may be looking forward, whilst an object behind the animal is examined with the other. The faculty of changing colour possessed by the Chameleons, although common to numerous other lizards, has become proverbial, and is so much developed that one side may assume a colour different from that of the other. They are oviparous, depositing, under leaves, from ten to twelve oval eggs with calcareous shells. The species have been left together in one genus: only one species is found in British India.

Chamæleo vulgaris.—The common Chameleon.

Lacerta chamæleo, *L. Syst. Nat.* p. 364.

Chamæleo ceylanicus, *Laur. Rept.* p. 46. *Jerdon, Journ. As. Soc. Beng. xxii.* p. 466.

L. vulgaris. *Daud. Rept. iv.* p. 181.

Most of the Indian specimens are of a green colour, uniform, or irregularly spotted and banded with dark green or brown; whilst in African specimens the ground-colour is greyish, olive, yellowish or brownish. This, however, does not appear to amount to a specific difference. Peninsula of India and in the northern parts of Ceylon, it attains to a length of 10 inches, the tail taking more than one-half.

A second species of Chameleon in India (*Ch. pumilus*, *Latr.*) is mentioned by *Jerdon (l. c.)*, but is extremely doubtful.

The Order of Snakes—Ophidia.

Body exceedingly elongate, without limbs, or with merely rudiments of limbs, scarcely visible from without; the ribs are articulated moveably with the vertebral column; no sternum; generally both jaws and the palate toothed; the mandibles united in front by an elastic ligament, and generally very extensible. Eyelids none. Integuments with numerous scale-like folds, rarely tubercular. There is no sharp boundary-line between the order of Saurians and that of Snakes. Certain Ophidians remind us, by several characters, of the Saurian type; such as the snakes forming the first four families (*Typhlopidae*, *Tortricidae*, *Xenopeltidae*, *Uropeltidae*), which are distinguished by polished, closely adherent, rounded, subequal scales, much resembling the smooth scales of some Scincoids. A peculiar mobility of the jaw-bones enables snakes to extend the gape in an extraordinary degree, and to work their prey down through the collapsed pharynx. The *Pythonidae* and *Erycidae*, have rudiments of hind limbs. Generally the snakes are provided with numerous teeth, which are elongate, conical, thin and pointed like a needle, and more or less bent backwards. In the *first sub-order*, that of *non-venomous snakes*, the teeth are either entirely smooth, or only the last of the maxillary series is provided with a faint longitudinal groove, which is not intended to convey a poisonous saliva into a wound, as the saliva of these snakes has never been proved to be poisonous; the groove appears to increase the strength of the tooth. The *poisonous snakes* are armed with a long canaliculated tooth in front of the upper jaw; the channel terminates in a small slit at the extremity of the tooth, and is in connexion with a duct which carries the poisonous fluid from a large gland to the tooth. At the moment the snake opens its mouth to bite, these muscles compress the gland, and force its contents through the excretory duct into the channel of the venom-tooth, whence it is injected into the wound. The structure of the venom-tooth is not the same in all poisonous snakes; in some it is fixed to the maxillary bone, which is as long, or nearly as long, as in the non-venomous snakes, and generally bears one or more ordinary teeth, on its hinder portion. The poisonous snakes with such a dentition have externally a more or less striking resemblance to the non-venomous serpents; and on this account they are designated as *venomous colubrine snakes*, forming the *second sub-order* of snakes (*Cobra*, *Bungarum*, *Sea-snakes*, &c.) In the other venomous snakes, the *third sub-order*, the maxillary bone is extremely short, and does not bear any teeth except an exceedingly long fang, with a perfectly closed,

externally invisible channel in its interior. Although this tooth also is fixed to the bone, the bone itself is very mobile, so that the tooth, which is laid backwards when at rest, can be erected the moment the animal prepares to strike. This tooth, like all the other teeth, is not only occasionally lost, but appears to be shed at regular intervals. The greater part of the snakes are oviparous, the eggs having an oblong form, and a soft, leathery shell. The Pythons alone incubate their eggs, whilst all the other oviparous snakes leave them to the heat of the place where they have been deposited. Other snakes (the freshwater and poisonous species) are viviparous, the embryos being developed in the oviduct of the mother. There may be distinguished.

1. *Burrowing Snakes*, living under ground only occasionally appearing above the surface.

2. *Ground Snakes*, live above ground, and only occasionally climb bushes or enter the water.

3. *Tree Snakes*, or species passing the greater part of their life on bushes and trees, which they climb with the greatest facility.

4. *Freshwater Snakes*, distinguished by the position of the nostrils, which are placed on the top of the snout, and by a tapering tail. They inhabit fresh waters, and are, therefore, excellent swimmers and divers.

5. *Sea Snakes*, distinguished by a strongly compressed tail, and by the position of the nostrils, which are placed as in the last group. They live in the sea only, occasionally approaching the land, feed on marine fish, are viviparous, and venomous.

Tropical India surpasses every other part of the globe in the number of Ophidian forms, and almost every investigation of a limited but previously unexplored district is sure to add largely to the knowledge of them.

The degree of danger from a bite by a poisonous Snake depends but little on the species which has inflicted the wound, but rather on the bulk of the individual, on the quantity of its poison, on the temperature, and on the place of the wound. If a large blood vessel be pierced by the fang, the poison is carried instantaneously into the mass of the blood, and sudden death is almost always the result. Although it is always possible to recognize the venomous nature of a snake from external characters only, yet this requires such a knowledge of snakes as can be attained only by a special study of them. The wound itself speaks for or against the venomous nature of a snake which has bitten. When there are numerous punctured wounds disposed in two lines, the snake is not poisonous. If the wound is on some part of the hand, arm, or foot, one or two ligatures should be made as tightly as

possible at a short distance above the wound to prevent the absorption of the poison. The ligature is left until the proper means are taken to destroy the virus in the wound and until medicine is taken internally, or until great pain or swelling necessitate its removal. Punctured wounds should be enlarged by incisions at least as deep as the wounds, to cause a free efflux of the poisoned blood, and to facilitate its removal by sucking. The wounds should be sucked either by the patient himself or by another person whose mouth is free from any solution of continuity; cupping-glasses answer the same purpose in cases where they can be applied. The wound should be washed with ammonia, and its vicinity rubbed with it. Cauterization with a red-hot iron, or with sulphuric acid, butter of antimony, nitrate of silver, &c., are of great advantage, if done before the virus has spread far beyond the place of the bite. Internally, ammonia should be taken in large doses—one, two, or three wine-glasses of the eau-de-luce. Where this is not at hand, from one to six glasses of brandy may be taken at short intervals. Dr. Shortt believes that ammonia is useless and has strong faith in *Liquor Potassæ*. To prevent a complete collapse, it is necessary to use these strong excitants, and to repeat them until the alarming symptoms are allayed. It would be a great risk in such a case to trust to the remedies of a snake charmer.

FIRST SUB-ORDER.

Ophidii Colubrifformes—Innocuous Snakes
Snakes without grooved or perforated fang-like teeth in front.

Family of Blind Snakes.—Typhlopidae.

Body cylindrical, with very short head not distinct from neck, and with a very short tail. The body and tail are covered with rounded, polished, imbricate scales, equal in size and form above and below; fore part of the head covered with large shields, upper labials four. Eye rudimentary, covered by, and more or less transparent from below, the shields; cleft of the mouth inferior, very short and narrow; jaws scarcely dilatible. A few teeth in the upper jaw only, none in the lower or on the palate; maxillaries very short, mandibles feeble; no longitudinal fold at the chin. This family contains forms which are most remote from the true Ophidian type. They live under ground, their rigid body and short curved tail being adapted for burrowing.

Typhlina, Wagler. Snout covered with large shields; rostral shield large, rounded in front; præocular none; nostril inferior; nasal and fronto-nasal simple. Lower jaw without teeth. Only one species is known.

Typhlina lineata. *Günther*.

Typhlops lineatus, *Boie, Isis*, 1827, p. 563.
Schleg. Abbild. p. 39. tab. 32. figs. 32-34 (incorrect).

Pilidion lineatum, *Dum. & Bibr.* vi. p. 259.

Typhlinalis lineatum, *Gray, Lizards*, p. 134.

Reddish olive above, with brown lines running along the joining edges of the longitudinal series of scales; these lines are either straight or in a short zigzag. Snout and belly yellow; tail either uniform yellow or with a yellow band across its back. Java, Sumatra, Penang, Hongkong; length 18 inches.

Typhlops (sp. Schneid.) Dum. & Bibr. Snout covered with large shields; rostral large, rounded in front; præocular present; nostril laterally in front of the snout.

Typhlops nigro-albus. Dum. & Bibr. vi. p. 295. *Cantor, Mal. Rept.* p. 51.

Argyrophis bicolor, Gray, Lizards, p. 136.

The back (eleven dorsal series of scales) is bluish black, the belly yellowish, both colours being well defined. This is found at Penang, Singapore, and in Sumatra, length 14 inches.

Typhlops horsfieldii.

Typhlops diardii, Schleg. Abbild. p. 39. *Dum. & Bibr.* vi. p. 300.

Argyrophis horsfieldii, Gray, Lizards, p. 137.

Blackish olive above, this colour gradually passing into the dull yellowish of the belly. Found in Khasya Assam, on the Tenasserim coast, and in Cochin China; length 17 inches.

Typhlops bothriorhynchus. Günth.

Uniform brownish olive above and below.

Typhlops striolatus, Peters, Monatsber. Berl. Acad. 1861, p. 922.—Olive brown above the darker terminal part of each scale separated from the lighter base by a yellow posteriorly black edged transverse, streak paler below. Length $12\frac{1}{2}$ inches. Banks of the Ganges.

Typhlops siamensis. Closely allied to *T. horsfieldii*. Upper and lateral parts uniform greyish olive, the lower yellowish. This species, $8\frac{1}{2}$ inches long; collected in Siam.

Typhlops braminus.

Rondoo Talooloo, *Russell. Ind. Serp.* i. 48. pl. 43.

Eryx braminus, Daud, Rept. vii. p. 379.

Tortrix russellii, Merr. Tent. p. 84.

Typhlops braminus, Ouw. Règne Anim. Dum. & Bibr. vi. p. 309. *Cantor, Mal. Rept.* p. 52.

T. russellii, Schleg. Abbild. p. 39.

Uniform brown, paler beneath; the upper shields of the head with a faint, crenulated, whitish marginal line. This is the most common species of Indian *Typhlopidae*, and almost generally distributed throughout the Indian continent and archipelago; it is common in Ceylon as well as in China and Nepal. It does not attain to any large size, the largest seen measuring 8 inches.

Typhlops tenuis. A single specimen, 5 inches long, has been received from Madras.

Typhlops mirus, Jam. Archiv. Zoolog. i. p. 185, uniformly coloured, like *T. braminus*; snout yellow. It is peculiar to Ceylon, where it appears to be rather local, being confined to the interior of the island. The longest specimen 5 inches long.

Onychocephalus, Dum. & Bibr. Snout covered with large shields; rostral with a trenchant anterior edge; præocular present; nostril at the lower side of the snout. Only one species is found in British India.

Onychocephalus acutus, Dum. & Bibr. vi. p. 333.

Typhlops russellii, Gray, Lizards, p. 132.

Onychocephalus westermanni, Lütken, in Natur. Hist. Foren. Vidensk. Meddel. 1862, Nov. 29, tab. 1, fig. 5.

Light bronze-coloured, each scale on the back lighter in the centre; below uniform yellowish. This is one of the best-marked. Blindworms in Madras, the Anamallay mountains, and the Deccan. Length 16 inches.

Family of Short-Tails—*Tortricidae*.

Body cylindrical, with a depressed, rounded head not distinct from neck; tail extremely short, conical, with its extremity smooth. Rudiments of hind limbs are hidden in a small groove on each side of the vent. The body is covered with rounded, polished, imbricate scales of moderate size, those in the ventral series being but little larger than the rest. Only one pair of frontals; six upper labials. Eye small. Cleft of the mouth of moderate width; teeth of the jaws in small number, rather stout, subequal in size; palatine teeth present. A longitudinal fold at the chin.

Cylindrophis, Wagler. Nostrils in a large undivided plate which forms a suture with the other nasal behind the rostral. Occipitals small. Eye small, with round pupil, surrounded by a supraorbital, a postocular, two labials, and the frontal; only one pair of frontals. No intermaxillary teeth. Two of the three species known are inhabitants of British India, the third (*O. Melanotus*) being, apparently, peculiar to the island of Timor. The *Cylindrophides* are burrowing animals, only occasionally found above ground; they feed on insects, worms, & small mammals living in earth-holes.

Cylindrophis rufus, Gray, Zool. Misc. p. 46, *Cantor, Mal. Rept.* p. 53.

Anguis rufa, Laur. Syn. Rept. p. 71.

Schilay Pamboo, *Russell, Ind. Serp.* ii. pl. 28.

Anguis scytale, Russell, ii. pl. 27.

Cylindrophis resplendens, Wagl. Ic. Amph. tab. 5. fig. 1.

Tortrix rufa, Schleg. Phys. Serp. p. 12, pl. 1. fig. 1-3.

Brown or black : belly with irregular white cross bands, extending more or less up the sides ; sometimes a white spot on each frontal. This spot, the collar, and the lower part of the tail are bright vermilion during life. Length 30 inches, found in many islands of the East Indian Archipelago (Java, Borneo), in Gamboja, at Singapore, and on the coast of Tranquebar.

Cylindrophis maculatus, *Wagl. Syst. Amph.* p. 195.

Anguis maculatus, *L. Syst. Nat.* i. p. 391
Russell, Ind. Serp. ii. p. 33, pl. 29.

Tortrix maculata, *Oppel, Rept.* p. 56. *Schleg, Phys. Serp.* ii. p. 12. pl. 1, figs. 6 & 7.

An oblique white band descends from the occiput to the throat. It attains rarely to the length of 2 feet, and is found only in Ceylon.

Family of Xenopeltides—Xenopeltidæ.

Body cylindrical, with a depressed, rounded head not distinct from neck ; tail short, tapering ; no rudiments of hind limbs. Scales rounded, polished, rather large ; ventral shields well developed. Two pairs of frontals ; occiput covered by five shields. Eye small, with subvertical pupil. Cleft of the mouth of moderate width. Teeth numerous in the jaws and on the palate, no longer tooth ; a longitudinal fold at the chin. Only one genus

Xenopeltis, *Reinwardt*. Upper labials eight, præocular large, replacing the loreal ; occiput covered by five shields ; scales in fifteen rows anal and subcaudals bifid. Only one species.

Xenopeltis unicolor, concolor, et leucocephalus, *Reinw. Isis*, 1827, p. 564.

Tortrix xenopeltis, *Schleg. Phys. Serp.* ii. p. 20. pl. 1. figs. 8-10.

Xenopeltis unicolor, *Cantor, Mal. Rept.* p. 54.

Old specimens are uniform brown or blackish above, and white below ; young individuals have a white head, and this part is frequently of a lighter coloration even in older examples. This snake attains to a length of 3-4 feet. Penang, Singapore, Gamboja, Sumatra, Java, Celebes, and Borneo.

Family of Rough-tails—Uropeltidæ.

Body cylindrical, with a short, narrow head not distinct from neck ; tail extremely short, truncated or scarcely tapering, generally terminating in a rough, naked disk, or covered with keeled scales (see *Melanophidium*). The body is covered with rounded, polished, imbricate scales, those in the ventral series being always somewhat larger than the rest. Only one pair of frontals ; four upper labials. Eye very small. Cleft of the mouth of moderate width ; teeth in small number, small, subequal in size, in the maxillary and mandibular bones, none on the palate. There is no longitudinal fold at the chin, except in *Melanophidium*. No rudiments of hinder extremities.

The species do not attain to a considerable size, and hitherto they have been found only in Ceylon and in the Peninsula of India. They are by no means scarce, but escape observation from their peculiar mode of life. In order to collect them, it is necessary to dig for them to a depth of 4 feet. According to Peters they are viviparous (*Bh. melanogaster*). They live on insects and worms.

Rhinophis, *Hemprich*.

Tail cylindrical, covered with smooth scales, terminating in a convex, scaleless, rough shield. Head conical ; nasal shields separated from each other by the rostral, which is produced backwards ; supraorbital and postocular confluent into one shield. Tail of the male longer than of the female. Ceylon only.

Rhinophis oxyrhynchus, *Hempr. Grundriss Nasurgesch.*, p. 119. *Dum. & Bibr.* vii. p. 154. *Peters, Uropet.* p. 9. tab. 2, fig. 1.

Typhlops oxyrhynchus, *Schneid. Hist. Amph.* ii. p. 341.

Dapatnaya lankadivana, *Kelaart, Prodr.* ii. p. 16. *Mytilia unimaculata*, *Gray, Proc. Zool. Soc.* 1858, p. 284.

Brownish, each scale with a lighter margin ; anal shields, and sometimes a spot on the upper or lower part of the tail, white ; caudal shields brown. 15 inches long, circumference of the thickest (anterior) part of the trunk being one-thirteenth or one-fourteenth of the total length. A native of Ceylon, common at Trincomalee and in the Kandyan Province, or three feet under ground in ant-hills.

Rhinophis punctatus, *Muller, Treveran. Zeitschr. Physiol.* iv. p. 248. *Dum. & Bibr.* vii. p. 157. *Peters, Uropelt.* p. 12. tab. 2. fig. 3.

Pseudotyphlops oxyrhynchus, *Schleg. Abbild.* p. 43. tab. 12.

Yellowish, each scale with a black or brown central spot ; the scales in the series adjoining the vertebral series without spot. Length 19 inches, appears to be one of the scarcest Ceylonese snakes.

Rhinophis philippinus, *Mull. Trevisan. Zeitschr. Physiol.* iv. p. 249. *Dum. & Bibr.* vii. p. 154. tab. 50. fig. 1. *Peters, Uropelt.* p. 15.

Typhlops philippinus, *Cuv. Règne, Anim.*

Snout acutely pointed ; the length of the rostral shields is much less than one-half of that blackish olive, each scale with a lighter margin ; præanal scales white ; sometimes some white blotches on the front part of the trunk, up to 16½ inches long. Found in Ceylon, and not in the Philippine Islands as stated by the French zoologists.

Rhinophis trevelyanus.

Dapatnaya trevelyana, *Kelaart, Prodr.* ii. p. 17. *Mytilia gerrardi*, *Gray, Proc. Zool. Soc.* 1858, p. 58, 263. tab. 13.

Rhinophis homolepis, (Hemprich) Peters, *Uropelt.* p. 14. tab. 2. fig. 2.

Upper parts black, the lower parts white, each scale with a black central spot; a series of triangular white spots along each side of the body; extremity of the tail white or whitish. Largest specimen, 11 inches long, the circumference of the thickest (anterior) part of the trunk being one-twelfth or one-thirteenth of the total length. A native of Ceylon, found on the Kandyan Hills, three or four feet under ground.

Rhinophis sanguineus, Beddome, *Proc. Zool. Soc.* 1863, p. 227.

R. microlepis, Beddome, *l. c.* pl. 26. fig. 2.

Caudal shields black, with a yellow median streak and with red outer margin. A large black spot on the lower side of the extremity of the tail. Numerous at Cherambady in the Wynad, at an elevation of 3,500 feet; all dug up in one spot; 13 inches long.

Rhinophis blythii, Kelaart, *Prodr.* ii. p. 14. Peters, *Uropelt.* p. 17.

Mytilia templetonii, Gray, *Proc. Zool. Soc.* 1858, p. 263 (old age).

M. melanogaster, Gray, *l. c.* p. 264 (male, not full-grown).

Plectrurus ceylonicus, Peters, *Monatsber. Berl. Acad.* 1859, p. 388.

Rhinophis melanogaster, Peters, *Uropelt.* p. 18. tab. 2. fig. 4.

Brownish above; belly sometimes paler, sometimes blackish; a series of five or six triangular yellowish spots. This is the most common species of Ceylon.

Rhinophis pulneyensis.

Plectrurus pulneyensis, Beddome, *Proc. Zool. Soc.* 1863, p. 228. pl. 25. fig. 2.

A yellow band along each of the tail, reaching across the vent. It is very abundant on the Pulney Hills, at elevations of from 7,000 to 8,000 feet. 8½ inches long, egg 9 lines long.

Uropeltis (part.), Cuvier. Tail cylindrical, obliquely truncated as if severed by a knife; the truncated portion flat, scaleless, rough. Head conical: nasal shields forming a suture together behind the rostral; supraorbital and postocular confluent into one shield. Ceylon. Only one species is known.

Uropeltis grandis.

Uropeltis philippinus, Cuv. *Regne Anim. Dum. & Bibr.* vii. p. 161. pl. 59, fig. 2. Peters, *Uropelt.* p. 20. Tennent, *Nat. Hist. Ceyl.* p. 322.

U. saffragamus, *grandis*, et *pardalis*, Kelaart, *Prodr.* ii. pp. 15 & 16.

The adult is uniform brown above. Found near Adam's Peak and Matura, and is rare; length 20 inches, being the largest species of this family.

Silybura, Peters, Gray. *Siluboura*, Gray. Tail subcylindrical, the scales on its upper posterior

side being shield-like and provided with one or several keels, forming together a flattish disk which terminates in a horny, bispinous, horizontal scale. Head more or less conical; nasal shields forming a suture together behind the rostral supraorbital and postocular confluent into one shield. Peninsula of India.

Silybura macrolepis, Peters, *Monatsber. Berl. Acad.* 1861, p. 904.

Black, a broad, irregular, yellowish band along each side of the front part of the trunk; traces of a similar narrow band are visible along the sides of the body; a yellow band along each side of the lower part of the tail. A female, 10½ inches long, probably a native of the peninsula of India.

Silybura beddomii, Gunth. *Ann. & Mag. Nat. Hist.* 1862, January, p. 56.

Brown: each scale on the sides with a pair of whitish dots; each ventral shield with a small whitish spot. A yellowish line along the side of the neck, commencing behind the angle of the mouth; vent and tip of the tail yellow. Discovered in the Anamallay Hills and Neilgherries, at elevations of from 3,000 to 4,500 feet; 11 inches long.

Silybura ocellata, Beddome, *Proc. Zool. Soc.* 1863, p. 226. A series of irregular, transverse, yellow, black-edged spots along each side of the belly corresponds to these bands. Belly brownish. On the western slope of the Neilgherries, at an elevation of 3,500 feet, in dense moist forests. 14½ inches long.

Silybura ellioti, Gray, *Proc. Zool. Soc.* 1858, p. 262.

Uropeltis ceylanicus, Cuv. *Régne, Anim.*

Siluboura ceylanica, Gray, *Lizards*, p. 142.

Coloburus ceylanicus, Dum. & Bibr. vii. p. 164. tab. 59. fig. 3.

Silybura ceylanica, *Pet. Mo. Berl. Ac.* 1861, p. 903. *S. nilgherriensis*, Beddome, *Proc. Zool. Soc.* 1863, p. 226. pl. 26, fig. 1.

Blackish brown above and below; a narrow yellowish streak runs from the angle of the mouth along each side of the neck; sometimes there are irregular small yellowish spots along the sides and on the back; the lower part of the tail is completely encircled by a yellow band. Length 11 inches. The neighbourhood of Madras and the Deccan, none from Ceylon.

Silybura bicatenata. Lower parts entirely black. This beautiful species is 9½ inches long. Deccan.

Silybura shorttii, Beddome, *Proc. Zool. Soc.* 1863, p. 225. Black: numerous irregularly disposed scales are white; an irregular white band from the angle of the mouth along each side of the front part of the trunk; a yellowish band along each side of the tail, not joined

over the vent. Shevaroy Hills, at an elevation of 4,500 feet; 8 inches long.

Silybura brevis, *Guth. Ann. & Mag. Nat.* Brown above; the lower part of the sides and the belly yellowish, densely marbled with brown; sides of the throat yellowish, immaculate; the lower part of the tail black, with a broad white band on each side.

Plectrurus, *Dum. & Bibr.*

Maudia, *Gray, Proc. Zool. Soc.* 1858, p. 261.

Posterior part of the tail compressed, covered with obtusely keeled scales, and terminating in a horny bicuspid scale, the two points being placed one above the other. Head conical; the nasals form a suture together behind the rostral; supraorbital and postocular distinct. Peninsula of India.

Plectrurus perrotetii. *Dum. & Bibr.* vii. p. 167. Uniform brownish or blackish. Common in the Madras Presidency and on the Neilgherries, from 7,000 to 8,000 feet. Length 14 inches. Frequently dug up in gardens or taken from under turf and stones.

Plectrurus guntheri, *Beddome, Proc. Zool. Soc.* 1863, p. 228. Beautiful purple above, each scale with a lighter margin; belly yellow, the yellow colour rising up on the sides in triangular markings, which are alternate with similar markings of the colour of the back, the purple spots sometimes joining those of the other side by narrow stripes crossing the belly. The moist forests at the western slopes of the Neilgherries (3,500 feet); 14 inches long.

Melanophidium, *Gthr.* Tail slightly compressed, covered with smooth scales, and terminating in a very small, smooth, horny point slightly turned upwards. Snout rather obtuse; nasal shields forming a suture together behind the rostral; supraorbital and postocular confluent into one shield. A median groove along the chin. Only one species is known.

Melanophidium Wynandense.

Plectrurus Wynandense, *Beddome*.

Snout obtuse. Black, posterior 2-3rds of the belly irregularly white and black.

Family of Dwarf Snakes.—*Calamaridae*.

Body cylindrical, rigid, with a short head which is not distinct from the neck, tail more or less short, tapering Indian species have the maxillary teeth of equal size.

Calamaria, *Bois*. S. scales smooth, rounded, polished in 13 series; anal entire; sub-caudals 2 rowed teeth equal in size and structure.

Calamaria catenata. *Blyth, Journ. As. Soc. Beng.* 1854, p. 287. An imperfect whitish-buff collar, and similar marks before and

behind the eye. Length 17 inches, the tail 2½ inches in Assam.

Calamaria reticulata, *Blyth, Journ. As. Soc. Beng.* 1854, p. 287. 12 inches, of which the tail is 2½ inches. Assam.

Calamaria siamensis. Ventrals and sub-caudals whitish, densely punctulated with only brown, the hind margins of the shields remaining immaculate.

Calamaria quadrimaculata. *Dum. & Bibr.* vii. p. 73. Lower parts uniform white; a faint blackish sub-caudal line. Upper part of the tail with two pairs of white spots, one at its base, and the other on its extremity. Found in Java.

Calamaria albiventer, *Gth. Colubr. Sn.* p. 4. *Changulia albiventer*, *Gray, Ind. Zool.*

Calamaria linnei, var., *Cantor, Mal. Rept.* p. 62.

Belly carmine, the brown coloration of the side just touching the margin of the ventral shields. A black serrated line along the middle of the subcaudals. Penang. Length 11 inches.

Calamaria nigro-alba.

Calamaria lumbricoidea, var., *Cantor, Mal. Rept.* p. 61 (not *Boie*).

Upper parts blackish, head somewhat lighter, all the lower parts and the outer series of scales whitish, immaculate, both colours being well defined; a faint blackish subcaudal line. Penang. Length 12-13 inches.

C. lumbricoidea, from Java, differs in the arrangement of the labial shields. *C. modesta*, from Java.

Calamaria leucocephala, *Dum. & Bibr.* vii. p. 83. Black above; head, neck, the two outer series of scales, and the lower parts white. 9 inches long. Probably from British India.

Macrocalamus, *Gthr.* Body cylindrical, stout; head of moderate length, slightly depressed, not distinct from neck; eye of moderate size, with rounded pupil; tail short. Only one pair of frontals; nasal simple, nostril between nasal and first labial; loreal none, united with frontal; one anterior and one posterior ocular; eight upper labials. Scales smooth, rounded, polished, in thirteen series; and entire; subcaudals two-rowed. Teeth equal. East Indies.

Macrocalamus lateralis. Brown: a dark-brown band, enclosing a regular series of whitish dots, runs along the side, bordering the belly; back with two series of indistinct brownish-black spots; an irregular series of very small black dots along each side of the belly, which is whitish; a blackish sub-caudal

band. Total length 12 inches; head $\frac{1}{2}$ inch, tail $1\frac{1}{2}$ inch, circumference of the body $1\frac{1}{2}$ inch, probably from the continent.

Oxycalamus, Gthr. Body cylindrical moderately stout; head narrow, pointed, not distinct from neck; eye of moderate size, with round pupil; tail rather short. Rostral very small; two pairs of frontal shields; two (?) very small nasals, nostril between; loreal none, replaced by the posterior frontal; one præanal, one post-ocular; five upper labials, the last in contact with the occipital. Scales smooth, in fifteen rows; anal entire; sub-caudals two-rowed. Teeth equal. Only one species.

Oxycalamus longiceps.

Calamaria longiceps, Cantor, Mal. Rept. p. 63.

Uniform brownish black, captured on the Great Hill of Penang, is $6\frac{1}{2}$ inches long, head measuring $\frac{3}{8}$ inch, and tail $\frac{1}{2}$ inch. Circumference of body $\frac{1}{2}$ inch.

Geophis, Wagler. Body cylindrical, stout or slender; head short, not distinct from neck; eye rather small, with round pupil; tail short or of moderate length. Two pairs of frontal shields; two small nasals, nostril between; loreal and præocular united into one elongate shield; one or two posterior oculars; rostral small. Scales smooth, rounded, without apical groove, in thirteen, fifteen, or seventeen series; anal entire; sub-caudals two-rowed. Teeth equal. Species of this genus are found in tropical America and in the East Indies. One or two occur in British India.

Geophis microcephalus.

Rhabdosoma microcephalum, Günth. Col. Sn, p. 12.

Brown; back with three more or less distinct series of small dark spots. Found near Madras, and attains to a length of 17 inches. Dumeril and Bibron describe a small snake from the Neilgherries under the name of *Platypteryx perroteti* which is evidently very similar to this species; *Geophis microcephalus* and *Platypteryx perroteti* cannot be referred to two different genera.

Aspidura, Wagler. Body rather stout or moderately slender; head more or less narrow, not distinct from neck; eye small, with round pupil; tail rather short; a single anterior frontal, two posterior; two very small nasals; loreal none, united with the frontal; one anterior ocular, sometimes united with frontal, two postoculars; six (five) labials. Scales smooth, in fifteen or seventeen series, those near the vent sometimes keeled or tubercular; anal and sub-caudals entire. Teeth equal. The snakes of this genus are peculiar to Ceylon, and may be readily distinguished by their smooth scales, single anterior frontal, and entire sub-caudal shields.

Aspidura brachyorrhos, Wagl. S. Amph. p. 191.

Scytale brachyorrhos, Boie, Isis, 1827, p. 517.

Calamaria scytale, Schleg. Phys. Serp. ii. p. 42.

Yellowish olive, with four indistinct darker longitudinal bands and with a vertebral series of black dots; an oblique black band on each side of the neck; belly uniform white. Rather common; 14-15 inches long.

Aspidura copii. A black, transverse spot behind the angle of the mouth; each labial with a black margin behind. Belly white, marbled with black, an adult male, $16\frac{1}{2}$ inches long.

Aspidura trachyrocta, Cope, Proc. Acad. Nat. Sc. Philad. 1860, p. 75. Nearly as common in Ceylon as *A. brachyorrhos*, and attains to a length of 15 inches.

Haplocercus, Gthr. Body very slender; head narrow, not distinct from neck; eye of moderate size, with round pupil; tail rather short, tapering; a single anterior frontal, two posterior; two very small nasals; loreal none, united with the frontal; one anterior ocular, two posterior; seven upper labials; scales keeled, lanceolate, in seventeen series; anal and subcaudals entire. Teeth equal. Ceylon.

Haplocercus Ceylonensis, Günth. Colubr. Snakes, 1858, p. 15.

Aspidura carinata, Jan. Arch. Zool. Anat. ii. 1862, p. 30.

Above uniform blackish, or light brown, with a narrow black vertebral line. Lower parts dull yellowish, immaculate. Length 19 inches.

Family of Oligodontes—Oligodontidae.

Body cylindrical or slightly compressed, rather rigid, with a short, subconical head, which is not distinct from neck; tail of moderate length, tapering. Body and tail covered with rounded, smooth scales, in fifteen, seventeen, nineteen, or twenty-one series. Belly rounded or slightly angulated; subcaudals two-rowed. Cleft of the mouth rather short; nostril lateral; eye of moderate size, with round pupil. Shields of the head normal (except in *Oligodon brevicauda*): rostral more or less enlarged, flat in front, but more or less produced far backwards. Maxillary teeth few in number, the last being the longest, not grooved. Head nearly always with symmetrical arrow-shaped markings. Small snakes, peculiar to the East Indies.

Oligodon, Boie. Rostral shield more or less enlarged, or produced backwards; two pairs of frontals, in one species confluent into a single pair; nostril between two partly confluent nasals; one præocular, one or two postoculars. Scales smooth, in fifteen or seventeen rows. Teeth in the maxillaries few

in number, the last larger than the others ; no teeth on the palate. The snakes of this genus are small, and confined to the peninsula of Southern India, Ceylon, and a few of the larger islands of the western part of the East Indian archipelago. Very little is known of the habits of these snakes. Their dentition is strong enough to enable them to seize other small snakes or lizards.

Oligodon sub-griseus.

Oligodon sub-griseum, *Dum. & Bibr.* vii. p. 59.

Belly uniform white ; some specimens have a minute black dot and the lateral edge of every second or third abdominal shield. Inhabits the southern parts of the peninsula of India. The Anamallay Mountains ; 19 inches long.

Oligodon spilonotus. This species is from the Madras Presidency. The largest of three specimens is 15 inches long.

Oligodon elliotti, from Madras, 10½ inches long.

Oligodon subpunctatum, *Dum. & Bibr.* vii. p. 58. Coast of Malabar.

Oligodon spinosopunctatus, *Jan. Arch. Zool. Anat.* ii. p. 40. Resembles *O. subpunctatus* in coloration, but has no spots on the belly.

Oligodon fasciatus. Belly whitish, with small brown spots, more numerous on the sides than in the middle. Deccan, total length 14 inches, of which the tail takes 2 inches.

Oligodon sublineatus, *Dum. & Bibr.* vii. p. 59. A small species, 10 inches long, common in and peculiar to Ceylon.

Oligodon affinis, *Gunth. Ann. & Mag. Nat. Hist.* Jan. 1862, p. 58. Anamallay Hills ; a specimen measures 10½ inches, of which the tail takes 1½ inch.

Oligodon templetonii, *Gunth. Ann. & Mag. Nat. Hist.* Jan. 1862, p. 57. Belly white, with square black spots, both colours being distributed in nearly equal proportion. Ceylon ; 10½ inches long, tail measuring 1½ inch.

Oligodon modestus. Philippine Islands ? Ceylon ? Adult male, 13 inches long, tail measuring 2 inches.

Oligodon dorsalis, *Gunth. Colubr. Snakes.* p. 22.

Elaps dorsalis, *Gray, Ind. Zool.*

Belly white, with quadrangular black spots, which are sometimes so numerous and so frequently confluent as nearly entirely to suppress the ground-colour. The middle of the lower surface of the tail always remains white. Probably Afghanistan ; total length 16 inches ; tail 3 inches.

Oligodon breviceuda, *Gunth. Ann. & Mag.*

Nat. Hist. Jan. 1862, p. 58. A blackish longitudinal streak on each side, along the third outer series of scales. Ground-colour of the belly the same as of the upper parts, with black quadrangular spots ; subcaudals whitish.

Oligodon dorsale of Bengal. Anamallay Mountains. Female, 15 inches long, the tail measuring 1 inch and 7 lines.

Simotes, Dum. & Bibr. Rostral shield more or less enlarged, truncated, bent and produced backwards ; anterior frontals narrow, transverse ; nostril between two nasals. Scales smooth, in seventeen, nineteen, or twenty-one rows. Teeth in the maxillaries few in number, the last longer than the others ; palatine teeth. These snakes are of rather fierce habits, but perfectly harmless.

Xenodon venustus. Gray.

Xenodon venustum, *Jerd. J. A. S. Beng.* xxii. 528.

Belly white, with quadrangular black spots, both colours being distributed in equal proportions. This species is rare on the west coast of the peninsula of India ; it attains to a length of 16 inches, the tail measuring 2½ inches.

Simotes russelii, D. & B. vii. p. 628.

Russell, Ind. Serp. i. tab. 35 & 38.

Coluber arnensis, Shaw, Gen. Zool. iii. p. 526.

C. russelii, Daud, Rept. vi. p. 395.

C. monticolus (Hodgson), C. P. Z. S. 1839, p. 51.

Coronella russelii, Schleg. Phys. Serp. ii. p. 78.

Brownish olive, with the bands on the head very distinct ; body with well-defined black, white-edged cross bands ; belly uniform white. Anamallay Mountains, Madras, Nepal, Sikkim, Dikhun, Ceylon. Common in the peninsula of India, extending northwards into Nepal, and the Himalaya, where it reaches an altitude of 4,100 feet above the level of the sea ; in Ceylon, it does not appear to be common. 25 inches long, tail 5 inches.

Simotes binotatus, D. & B. vii. p. 630.

Xenodon dubium, Jerd. J. A. S. Beng. 1853, p. 528. Lower parts uniform white. Coast of Malabar ; North Canara.

Simotes albiventer.

Simotes purpurascens, var. F. Gunth. Col. Sn.

Uniform greyish brown above, whitish below ; a dark spot below the eye. Ceylon. Total length 24 inches ; tail 3½ inches.

Simotes signatus.

Simotes purpurascens, var. F. Gunth. Colubr. Snakes, p. 26.

Brown, with reddish-white cross bands edged with darker. Belly whitish, with a few small brown lateral spots anteriorly. 21 inches long ; tail 5 inches. 15 inches long ; tail 3 inches, said to be from Singapore.

Simotes cinereus. Uniform brownish grey

above, white below ; a very indistinct spot below the eye. From Gamboja ; it is 17 inches long without the tail.

Simotes swinhonis. Reddish olive above, with numerous indistinct reticulated cross bands, produced by the blackish edges of some of the scales. Head with scarcely any trace of markings. Lower parts pure white.

Simotes tæniatus, *Günth. Proc. Zool. Soc.* 1861, p. 189. Body brownish olive, belly white, with quadrangular black spots, two large blackish spots on the back of the tail—one at its root, the other near its extremity. Gamboja and neighbourhood of Bangkok, length 15 inches, tail 2 inches.

Simotes trilineatus, *Dum. & Bibr. vii. p. 636*. Indian continent, place not known.

Simotes punctulatus.

? *Coronella violacea*, *Cant. P. Zl. S.* 1839, p. 50. *C. punctulatus*, *Gray, Ann. & Mag. Nat. Hist.* 1853, xii. p. 389.

Simotes purpurascens, var. *D. & E. Günth. Colubr. Snakes*, p. 25.

Belly with more or less confluent square black spots. Khasya, Nepal, Sikkim, a mountain species, found in different parts of the Himalaya, where it ascends into the temperate zone to above 4,000 feet above the level of the sea. Although living at a higher altitude than most of its congeners, it attains to the large size of from 2½ to 3 feet. *Simotes labuanensis*. A species from Labuan, very similar to *S. punctulatus*, but distinguished by a greater number of temporals, viz. 2+3. Ventrals 172-187 ; subcaudals 60.

Simotes bicaenatus. Belly yellowish, 21½ in. long, tail 3½ inches ; probably a native of the continent of India. *Coronella cyclura*, *Cantor, Indian Snakes, Proc. Zool. Soc.* 1839, p. 51.

Simotes albocinctus, *D. & Bibr. vii. p. 633*.

Coronella albocincta, *Cant. P. Z. S.* 1839, p. 50.

Brownish, with about eighteen white, dark-edged cross bands. Assam Cherra-Punji.

Simotes fasciolatus.

Simotes trinotatus, var. *G.P.Z. S.* 1860, p. 114.

Yellowish olive above ; fronto-labial band distinct. A broad lighter band runs along each side of the back ; tail with a median whitish longitudinal band. Lower parts pure white, Pachebone. 19 inches long, tail 3 inches.

Simotes cochin-chinensis. Greyish olive, with twelve black cross bands on the trunk, and three on the tail. Markings of the head deep black ; lower parts pure white ; one young specimen of this species, which was found by M. Mouhot in the Lao Mountains ; it is 7 inches long, the tail measuring 1 inch.

Simotes trinotatus, *Dum. & Bibr. vii. p. 631*.

Xenodon purpurascens, *Cantor, Mal. Rept. p. 67*, (not Schleg.)

Yellowish brown, with a triple series of darker, black-edged spots. China.

Family of Colubridæ—Colubridæ.

This family comprises the greater part of the non venomous snakes, namely all those which do not present any striking character either in their general habit, in the shields of the head, in the dentition, or in any other part of their organization : we therefore describe the body as of moderate length compared with its circumference, flexible in every single part ; the head is well-proportioned in every dimension, and distinct from neck ; the eye of moderate size, the nostril lateral ; the cleft of the mouth in accordance with the length of the head. They have numerous teeth in the jaws and on the palate, but no fangs in front or in the middle of the maxillary. The subcaudals are two-rowed ; and the chin-shields symmetrically arranged, separated by a longitudinal mental groove. These snakes are found in every part of the temperate and tropical regions, but are only scantily represented in Australia and in the islands of the Pacific.

Group of ground colubridæ—*Coronellina*.

Group of true colubridæ—*Colubrina*.

Group of bush colubridæ—*Dryadina*.

Group of freshwater colubridæ—*Natricina*.

Ablabes, sp., *Dum. & Bibr.* Body cylindrical, not compressed, rather slender ; head of moderate length, rather depressed, with flat crown, more or less distinct from neck ; tail of moderate length or rather long ; eye of moderate size, with round pupil. Rostral shield not produced backwards ; two nasals ; one loreal ; one or two anterior and one or two posterior oculars. Scales smooth, in thirteen, fifteen, or seventeen rows ; ventrals not angulated ; anal bifid ; subcaudals two-rowed. Teeth in the jaws and on the palate numerous, small, and of equal size. The snakes of this genus are small, living on the ground, and are found in North America and in the East Indies.

Ablabes baliodeirus, *Dum. & Bibr. vii. p. 313. Günth. Colubr. Snakes*, p. 29.

Coronella baliodeira (Boie), *Schleg. Phys. Serp.* ii. p. 64, pl. 2. figs. 9, 10. *Cantor. Mal. Rept.* p. 66.

Above brownish or black, yellowish on the head ; uniform pearl-coloured below ; Borneo, Java, and at Penang. Longest specimen 14 inches, tail 3½ inches.

Ablabes tenuiceps.

Calamaria tenuiceps, *Blyth. Journ. As. Soc. Beng.* xxiii. p. 288.

Above uniform blackish ash ; below whit-

ish, Nepal Darjiling, 14 in. long, tail 2 inches.

Ablabes fuscus.

Calamaria fusca, *Blyth, Journ. As. Soc. Beng.* xiii. 1854, p. 238.

? *Calamaria obsкуро-striata*, *Blyth, l. c.*

Trachischium rugosum, *Gunth. Colubr. Snakes*, pp. 30, 245.

T. fuscum, *Gunth. Proc. Zool. Soc.* 1860, p. 161.

T. obsкуро-striatum, *Gunth. l. c.*

Uniform black above, whitish below. Found in Nepal and Sikkim, and reaching an altitude of 8,500 feet. Largest specimen, 19 in. long, tail 2½ inches.

Ablabes rappii, *Gunth. Proc. Zool. Soc.* 1860, p. 154.

Ablabes owenii, *Gunth. l. c.* p. 155.

Uniform blackish above, whitish below. From Sikkim, at altitudes of 5,340 and 10,200 feet also from Nepal. Length 16½ inches, tail 3½ inches.

Ablabes bicolor.

Calamaria bicolor, *Blyth, Journ. As. Soc. Beng.* xiii. 1854, p. 289.

Uniform greyish brown above, whitish below; was 19½ inches long (tail 4¾), either from Khasya or from Assam.

Ablabes olivaceus, *Beddome, Madr. Quart. Journ. Med. Sc.* vol. v. Dark greenish olive, paler below; this species was discovered by Neilgherries, Manantoddy; 20½ inches long, tail 4 inches.

Ablabes sagittarius.

Calamaria sagittaria, *Cantor, Proc. Zool. Soc.* 1839, p. 49; and *Mal. Rept.* p. 64.

Enicognathus grayi, *Jan. Arch. per la Zool.* ii. p. 274.

Reddish or greyish olive; head brown above; belly white, found at Penang, and at Tirhoot in Bengal, and Kangra (Himalayas).

Ablabes humberti.

Calamaria sagittaria, *Jerdon, Journ. As. Soc. Beng.* xii. 1853, p. 528 (not Cantor).

Enicognathus humberti, *Jan, Arch. Per la Zool.* ii. p. 275.

Reddish olive, darker on the sides, belly white, Madras Presidency, Ceylon. 17½ inches long, tail 4 inches.

Ablabes collaris, *Gunth. Col. Snakes*, p. 28.

Psammodphis collaris, *Gray, Ann. & Mag. Nat. Hist.* 1853, p. 390.

Greyish brown above; lower parts white; Khasya and Nepal, length 32 inches, tail 10 inches.

Ablabes melanocephalus, *Gunth. Col. S.* p. 28.

Lyceodon melanocephalus, *Grey, Ind. Zool. c. fig.* *Herpetodryas prionotus*, *Cantor, Proc. Zool. Soc.* 1839, p. 52.

Light brown above, with two white longitudinal bands, commencing from a broad black collar, and becoming indistinct towards the hinder parts of the body; each band is

interrupted by a series of quadrangular, equidistant black spots; head brown above; lips yellow, with a black band running from the eye to the angle of the mouth. Lower parts whitish, each ventral with a black spot on each side. Malacca, length 22 in.; tail 8 inches.

Cyclophis, *Gthr.* Body or tail or both rather slender; belly rounded; head of moderate length, rather distinct from neck. Shields of the head regular; loreal present, or confluent with the nasal; only one nasal, pierced by the nostril; one (two) anterior and two posterior oculars. Scales smooth, in fifteen rows. Eye of moderate size, or rather large, with round pupil. All the teeth of equal size, none grooved. The snakes of this genus are small intermediate forms between the *Coronellina* and the *Dryadina*; like the former, they appear to be ground snakes, frequenting grassy plains rather than dry places; therefore their predominant colours are green or olive. One species is known from North America; the others are from the Indian continent and from Ceylon.

Cyclophis major, *Gunth. Col. Snakes*, p. 120. *Herpetodryas chloris*, *Hallow. Proc. Acad. Nat. Sc. Philad.* 1860, p. 503.

Uniform green above, paler beneath. Ningpo and Hongkong. 37½ inches long, the tail measuring 9 inches; another is 30½ inches long, tail 7 inches.

Cyclophis frenatus, *Gunth. Colubr. Snakes*, p. 120. Crown of the head, back and posterior part of the body; uniform olive; uniform yellowish below. Afghanistan, Mesopotamia. 27 inches long, the tail measuring 8 inches.

Cyclophis calamaria, *Gunth. Colubr. Snakes*, p. 250. Greyish or brownish grey above; not uncommon in Ceylon, but scarcer in the peninsula of India, and attains to a length of 13—14 inches, the tail measuring 4 inches.

Cyclophis nasalis. Greyish olive above; belly uniform whitish. British India, 16 inches long, the tail measuring 4 inches.

Cyclophis monticola.

Calamaria monticola, *Cant. Pr. Z.S.* 1839, p. 50.

Dark olive-brown, with a bright yellow collar and with a whitish dorsal line; beneath of a citrine colour, only 50 lines long, the tail measuring 9 lines. This species inhabits the Naga Hills in Assam.

Odontomus, *Dum. & Bibr.* Body and tail slender, strongly compressed; head of moderate size and width, depressed, distinct from neck; ventrals more than 200 in number, angularly bent on the sides. Scales in thirteen or fifteen rows, smooth. Shields of the head regular; nostril in a nasal shield which is divided into two by more or less distinct

nature. Two præoculars, the lower of which is sometimes united with the loreal. Maxillary and palatine teeth subequal in length, none grooved; the anterior mandibular teeth but little larger than the following. Eye of moderate size, with round pupil.

Odontomus nympha, D. & B. vii. p. 450. *Russell, Ind. Serp.* ii. tab. 36, 37.

Coluber nympha, Daud. *Rept.* vi. p. 244.

Lycodon nympha, Boie, *Isis*, 1827, p. 522. *Schleg. Phys. Serp.* ii. p. 120.

White, with about thirty-eight rounded, broad brown bands. The head appears to be sometimes entirely yellowish. Russell obtained them from Vellore; the largest is 17 inches long, tail $3\frac{1}{2}$ inches.

Odontomus semifasciatus.

Hydrophobus semifasciatus, Gunth, *Ann. & Mag. Nat. Hist.* 1862, Febr. p. 127.

White, with fifty rounded, dark-brown bands.

Odontomus gracilis. White, with about thirty-eight broad, round, dark-brown cross bands. Lower parts uniform white. Anamalai Mountains, Waltair: it is 21 inches long, the tail measuring 4 inches.

Nymphophidium, Gthr. This genus agrees with *Odontomus* in every respect but the dentition, the three posterior maxillary teeth being very strong and trenchant; neither the palatine nor the mandibular teeth are enlarged.

Nymphophidium maculatum. Light brownish, lower parts uniform whitish.

Coronella, sp., *Laurenti*. Body cylindrical, not compressed in the middle, stout; head of moderate length, rather flat, and distinct from neck, with the snout rounded; tail of moderate length; eye moderately large, with round pupil. Rostral shield of normal size and form; two pairs of frontals; nostril between two nasals; one loreal; one anterior and two or three posterior oculars. Scales smooth, in (fifteen) seventeen to twenty-three rows; subcaudals two-rowed. Posterior maxillary tooth longest, smooth, and in a continuous series with the anterior ones, or grooved.

Coronella orientalis. Above greyish brown. Belly white, with subquadrangular blackish spots.

Coluber, sp., *Linn*. Body rounded above generally of moderate length; tail one-fifth or less than one-fifth of the total length; eye of moderate size, with round pupil; nostril lateral, between two plates. Shield of the head regular; one præocular. Scales smooth or with feeble keels, in nineteen to twenty-seven rows; ventrals not keeled; anal bifid. Teeth in the jaws of equal size. Numerous species of this genus are found in North America, Europe, and Asia; those in British India belong to the

northern parts of this region, scarcely extending southwards into the tropical region.

Coluber rufo-dorsatus, Gunth. *Col. Sn.* p. 89.

Tropidonotus rufo-dorsatus, Cantor, *Ann. & Mag. Nat. Hist.* 1842, ix. p. 483.

Ablabes sex-lineatus, Dum. & Bibr. vii. p. 324.

Upper parts brownish grey, with four series of oblong, irregular, brown, black-edged spots. A series of black spots along the edge of the abdomen; belly with more or less numerous and confluent subquadrangular black spots. China, (Ningpo, Chikiang) and in the islands of Chusan and Formosa. 19 inches, tail being 3 inches. A frog was found in the stomach of one.

Coluber mandarinus, Cantor, *Ann. & Mag. Nat. Hist.* 1842, ix. p. 483. Scarlet above with a dorsal series of about forty-four lozenge-shaped black spots, an inhabitant of Chusan; the largest 28 inches long, the tail measuring 5 inches.

Coluber porphyraceus, Cantor, *Proc. Zool. Soc.* 1839, p. 51.

Psammophilus nigrofasciatus, Cantor. l. c. p. 35.

Coronella callicephalus, Gray, *Ann. & Mag. Nat. Hist.* 1853, xii. p. 390. *Blyth, Journ. As. Soc. Beng.* xxiii. 1855, p. 289.

Coluber callicephalus, Gunth. *Col. Snakes*, p. 92.

Brownish olive above. Belly uniform whitish. Appears to be confined to Khasya and Assam; largest specimen is 29 inches long, the tail measuring $5\frac{1}{2}$ inches.

Elaphis, sp., *Aldrovandi*. Body and tail generally elongate and compressed; ventral shields 200 or more in number; head distinct from neck; the length of the tail is less than one-fourth of the total; eye of moderate size, with round pupil; nostril lateral, between two shields; shields of the head regular; two præoculars, the lower small. Scales keeled; ventrals with a slight, or without any, keel; anal bifid. Maxillary teeth in size.

Elaphis dione, Dum. & Bibr. vii. p. 248.

Gunth. Colubr. Snakes, p. 92.

Coluber dione, Pall. *Zoogr. Ross. As.* iii. pp. 39, 40.

Cœlopeltis dione, Eichw. *Nouv. Mem. Nat. Mosc.* 1842, vii. p. 151. tab. 28.

Upper parts brownish or yellowish olive, minutely speckled with red. Belly white with black spots. From the western parts of Asia, through entire Central Asia to China, (at Pekin) longest specimen, a male, 39 inches long, the tail measuring $8\frac{1}{2}$ inches.

Elaphis sauromates, Dum. & Bibr. vii. p. 288.

Gunth. Colubr. Snakes, p. 93.

Coluber sauromates, Pall. *Zoogr. Ross. As.* iii. p. 42. *Nordm. in. Demid. Voy. Russ. Merid., Rept.* pl. 7.

Elaphis pareysii, (Fitz.) Wagl. *Icon.* tab. 25.

Tropidonotus sauromates, Eichw. *Faun. Casp. Caucas.* pl. 25. fig. 1 & 2.

Anterior part of the trunk with broad black cross bands, separated from each other by nar-

row yellow interspaces, and more or less confluent on the hinder part of the trunk. Belly yellow; in the Chinese specimen marbled with black, and entirely black posteriorly. This species appears to have the same geographical range as *E. diene*, viz. from the shores of the Caspian Sea to the most eastern parts of China.

Elaphis tæniurus, Cope Pr. Ac. Nat. So. Phil. 1860.

E. virgatus, var. (species) Gunth. Col. Sn. p. 95. Back greenish olive; numerous black streaks across the anterior part of the trunk. Chikiang, Ningpo, China.

Composoma, Dum. & Bibr. Body elongate compressed ventral shields more than 103 in number.

Composoma radiatum, Russ. In. Serp. ii. tab. 43.

Coluber radiatus Reinw. Schleg.

C. quadri-fasciatus, Cantor.

Tropidionotus quinque-fasciatus, Cantor.

Light yellowish-bay above and behind, paler on the sides. Lower parts uniform yellow; a series of black longitudinal streaks along the edges of the anterior third of the abdomen. This fine species is peculiar to the western parts of India; it is found in Java and Sumatra, in the Malayan peninsula, on the coast of Tenasserim, in Assam and Cochin-China, and, finally, in the Khasya Mountains and Sikkim. It attains to a length of 6 feet, the tail being rather more than one-sixth; it not only inhabits bushes, but, at Penang, it is also numerous in marshes and paddy-fields. It is equally nocturnal and diurnal, preying on rats, birds, lizards, and frogs. Cantor found in a female twenty-three eggs.

Composoma melanurum, D. & B. vii. p. 299.

Coluber melanurus, Schleg. Phys. Serp. ii. p. 141. pl. 5. figs. 11, 12; and Abbild. taf. 5.

Spilotes melanurus, Gunth. Col. Snakes, p. 97.

Ground-colour of the anterior parts brownish, gradually passing into black posteriorly. The lower parts uniform yellow, black posteriorly. This species is found in Beugal, China, Sumatra, Java, Celebes, and other islands of the East Indian archipelago. 65 inches long, the tail measuring $14\frac{1}{2}$ inches.

Composoma reticulare.

Spilotes reticularis, Gunth. Colubr. Snakes, p. 98.

Coluber reticularis, Cant. P. Z. S. 1839, p. 51.

Blackish brown; behind black, with numerous narrow whitish cross bands. Belly yellowish, spotted or marbled with black, sometimes uniform black. It is numerous in different parts of the Himalayas—Nepal, Sikkim, Khasya: Chirra Punji. The largest specimen 46 inches long, the tail measuring 9 inches.

Composoma hodgsonii.

Spilotes hodgsonii, Gunth. Proc. Zool. Soc. 1860, p. 156, pl. 27.

This species appears to be rather scarce; specimens from Nepal Ladak, Tibet, stated to have been captured at an altitude of 15,200 feet. 51 inches long, the tail measuring 11 inches.

Cynophis, Gray. Body rather slender and compressed; head narrow; tail one-fifth of the total length; trunk with more than 200 short ventral shields; eye of moderate size, with round pupil; nostril lateral, between two plates. Shields of the head regular; one præocular. Scales slightly keeled or with a pair of apical grooves, in from twenty-five to twenty-seven series. Anal entire. Teeth numerous in the jaws and on the palate, subequal in size.

Cynophis helena, Gunth. Col. Snakes, p. 95.

Russell, Ind. Serp. i. tab. 32.

Coluber helena, Daud. Rept. vi. p. 277.

Herpetodryas helena, Sch. Phys. Serp. ii. p. 192.

Cynophis bistrigatus, Gray. Ann. & Mag. Nat. Hist. 1849, iv. p. 246.

Plagiodon helena, Dum. & Bibr. vii. p. 170.

Reddish olive, with numerous more or less distinct, reticulated, black transverse bands across the anterior part of the back, each of which encloses two white ocelli on either side of the body, one above the other. Lower parts uniform white. Not uncommon in Ceylon, but rarer in the Madras Presidency. The largest specimen observed measures 42 inches, the tail being 8 inches. It feeds on field mice and rats.

Cynophis malabaricus.

Herpetodryas malabaricus, Jerdon, Journ. As. Soc. Beng. xxii. 1854, p. 530.

Light brownish olive. This beautiful species, is not very rare in Malabar; specimens from the Anamallay Mountains, through Captain Beddome: the largest is 15 inches long, the tail measuring 3 inches; it had swallowed a mouse.

Ptyas, Fitzinger. Body elongate, more or less compressed; tail one-third or rather more than one-third of the total length; head distinct from neck; eye rather large; nostril lateral, between two plates. Shields of the head regular; two præoculars; two or three loreals. Scales smooth or feebly keeled, in fifteen or seventeen rows; ventrals without keel; anal bifid. Maxillary teeth gradually increasing in length posteriorly.

Ptyas mucosus, Cope, ibid. p. 563.

Coluber mucosus, L. Mus. Ad. Fried. t. 13. fig. 2. t. 23. fig. 2. Russell, Ind. Serp. i. pl. 34; ii. pl. 18. f. 2 (young).

Coluber blumenbachii, Merr. Tent. p. 119 Schleg. Phys. Serp. ii. p. 137. pl. 5. figs. 7 & 8.

C. dhumna, Cantor, Proc. Zool. Soc. 1839, p. 51.

Leptophis trifrenatus, Hallowell, Proc. Acad. Nat. Sc. Philad. 1860, p. 503.

The Indian rat-snake. It is light brownish olive, scales with darker margins is one of the most common species on the continent and in Ceylon, and appears to occur everywhere; it is scarce in the archipelago, as its occurrence has been recorded in Java only; on the other hand, it is not rare in Chusan and Formosa. In the Himalaya it ascends to only 5,240 feet above the level of the sea. It is a powerful snake, attaining to a length of 7 feet, the tail being one-third or rather more. Its food consists of mammals, birds, and frogs; it frequently enters the dwellings of man in search of mice, rats, and young fowls. It is of fierce habits, always ready to bite, and old examples bought to Europe never become tame. Cantor says that it utters, when irritated, a peculiar diminuendo sound, not unlike that produced by a gently struck tuning-fork.

Ptyas korros, *Cope, Proc. Acad. Nat. Sc. Philad.* 1860, p. 563.

Coluber korros, (*Reinw.*), *Schleg. Phys. Serp.* ii. p. 139, and *Abbild.* p. 99. pl. 27, & pl. 28. figs. 1-6. *Cantor. Mal. Rept.* p. 74.

Light or dark brownish-green above. Lower parts uniform yellowish, *Pt. korros* has a more limited range than *Pt. mucosus*; it is found in Java and Sumatra, Siam, the Malayan peninsula, Arakan, Tenasserim, and southern China. Its habits are similar to those of *Pt. mucosus*; but a specimen more than 60 inches long, never seen, the tail measuring 24 inches.

Xenelaphis, Gthr. Body elongate, not compressed; tail more than one-third of the total length; head rather short; eye of moderate size, with round pupil, nostril lateral, between two plates. Shields of the head regular; two preoculars; one loreal. Scales smooth, without apical groove, in seventeen rows, those of the vertebral series enlarged, six-sided; ventrals not keeled; anal bifid. Jaws with numerous teeth subequal in size. Only one species is known.

Xenelaphis hexahonotus.

Coluber hexahonotus, *Cantor. Mal. Rept.* p. 74. *Coryphodon hexahonotus*, *Gunth. Co. Sn.* p. 110.

Brown, with black cross bands in immature specimens. Lower parts uniform yellowish. This species is scarce; it is found in Arakan, Penang, Singapore and Borneo. It attains to a length of 62 inches, the tail measuring 25 inches, the head only $1\frac{1}{2}$ inch.

Zamenis, Wagler. Body and tail elongate; trunk with 200 or more ventral shields; head distinct from neck, flat; eye of moderate size, with round pupil; nostril lateral, between two plates. The shields of the head have a tendency to divide in two or more pieces; loreal, present; generally two anterior and

two posterior oculars; eye sometimes surrounded by separate pieces of the upper labials. Scales smooth or slightly keeled; ventrals rounded or with a very indistinct lateral keel; anal bifid; subcaudals two-rowed. Teeth numerous in the jaws and on the palate; the last maxillary tooth is generally the largest, and separated from the others by a short interspace. This genus of Colubrine snakes is confined to the countries round the shores of the Mediterranean, extending eastwards through South-western Asia to the peninsula of Southern India.

Zamenis diadema.

Russell, ii. p. 34. pl. 30.

Coluber diadema, *Schleg. Phys. Serp.* ii. p. 148. (not *Blyth*).

Ground-colour yellowish olive, with a dorsal series of round brown spots; two series of short brown longitudinal streaks run along each side of the body. It is found in Afghanistan, Sindh, Kurrachee, Bombay.

Zamenis ventrimaculatus, var. A. Gunth. *Colubr. Snakes*, p. 106.

Coluber ventrimaculatus, *Gray. Ind. Zool. c. fig. C. diadema*, *Blyth. Journ. As. Soc. Beng.* xxiii. (1855) p. 291 (not *Schleg.*).

Yellowish olive, with numerous very distinct narrow black cross bars on the back. A black cross band between the eyes. The coloration here described is peculiar to the Indian variety of a species which extends throughout the whole of South-western Asia to Egypt, and the Egyptian variety of which is known by different names—*Z. florulentus*, &c. The typical specimens of *Z. ventrimaculatus* are said to be from Bengal, but it is more probable that they came from the western parts of the Indian region. A specimen which was received from Mesopotamia agrees completely with the types: the largest of the latter is a mature female, 35 inches long, the tail measuring 9 inches; examples seen were about 4 feet long.

Zamenis gracilis, Gunth. Ann. & Mag. Nat. Hist. 1862, February, p. 125. Yellowish olive, with a single series of large round brown spots edged with black, along the anterior half of the trunk. An irregular series of black spots on each side of the belly, which is uniform yellow.

Zamenis fasciolatus. Rus. Ind. Serp. i.

Coluber fasciolatus, *Shaw, Zool.* iii. p. 528. *Cantor. Mal. Rept.* p. 72.

C. hebe, *Daud. Rept.* vi. p. 385.

C. curvirostris, *Cantor. Proc. Zool. Soc.* 1880, p. 51.

Coryphodon fasciolatus, *Gunth. Colubr. Snakes*, p. 109.

Tyria fasciolata, *Cope, Proc. Acad. Nat. Sc. Philad.* 1862, p. 338.

Yellowish or brownish olive above, with narrow, equidistant, white, brown and black variegated cross bands, lower parts uniform yellowish, not uncommon in the peninsula of India; it appears to be scarce in Bengal; a single specimen was found in the Province Wellesley by Dr. Cantor. It attains to a length of 41 inches, the tail measuring 9 inches.

Zaocys, Cope. Body elongate and compressed; ventral shields about 200; tail elongate, its length being one-fourth or more than one-fourth of the total. Head distinct from neck of moderate length, rather elevated; eye large, with round pupil. Shields of the head regular; superciliaries large, convex; two præoculars, the upper of which is large, not reaching the vertical, the lower small; two postoculars. Scales in fourteen or sixteen rows, those of the median series generally keeled. Anal bifid. Teeth in the jaws subequal in size; those of the maxillaries in a continuous series, rather larger behind.

Zaocys dhumnades, Cope. Proc. Acad. Nat. Sc. Philad. 1860, p. 563.

Coluber dhumnades, Cantor. Ann. Mag. Nat. Hist. 1842, ix. p. 483 and *Mal. Rept.* p. 74.

Ablabes vittatus, Dum. & Bibr. vii. p. 326.

Coryphodon carinatus, var. Gunth. Col. Sn. p. 112.

Greenish anteriorly. Tail and posterior half of the trunk entirely black. Island of Chusan, Ningpo. The longest specimen measures 70 inches, the tail being 20 inches.

Zaocys carinatus.

Coryphodon carinatus, spec. a, Gunth. Colubr. Snakes, p. 112.

Brownish olive anteriorly, with reticulated white cross bands; belly and lower part of the tail with series of round white spots: 10 feet long, the tail being one-fourth Borneo.

Zaocys nigromarginatus. Gunth.

Coluber nigromarginatus, Blyth, Journ. As. Soc. Beng. xxiii. p. 290.

Coryphodon carinatus, var., Gunth. Colubr. Snakes, p. 113, and *Proc. Zool. Soc.* 1860, p. 167.

Nepal, Sikkim, and Khasya; it belongs to the fauna of the temperate zone of the Himalayas, reaching an altitude of 7,100 feet above the sea; largest specimen is seen 8 feet long, the tail measuring 27 inches.

Herpetoreas, Gthr. Body and tail slender, compressed; trunk with more than 200 ventral shields; head somewhat elongate, rounded in front, flat above; eye of moderate size with round pupil; nostril lateral, between two shields. Shields of the head regular: loreal present; one anterior, two posterior oculars. Scales moderately elongate, slightly keeled, in nineteen rows; ventrals strongly bent up the sides; anal bifid. The posterior maxillary

tooth is the longest, in a continuous series with the anterior ones. Only one species is known.

Herpetoreas sieboldii, Gunth. Proc. Zool. Soc. 1860, p. 156. The upper parts are uniform greenish brown, the lower parts yellowish; the ventrals have an elongate spot on each side, procured by Messrs. von Schlagintweit in Sikkim, at 7500 feet, above the level of the sea. Total length 3 feet 1 inch: length of the head 10 lines, of the tail 9 inches.

Coluber prasinus, (Blyth, Journ. As. Soc. Beng. xxiii. p. 291. from Assam and Tenasserim, is perhaps the same snake.

Tropidonotus, Kuhl. Body cylindrical; head distinct from neck, flat, cleft of the mouth wide; eye of moderate size, or rather large, with round pupil; nostril lateral, between two plates. Shields of the head regular; loreal always present. Scales keeled; ventrals rounded, considerably less than 200 in number; anal bifid; subcaudals two-rowed. Teeth numerous in the jaws and on the palate: the anterior in the jaws are always shortest; the posterior lengthened, but not grooved. The *Tropidonoti* are found in North America, Europe, Asia, the East Indian Archipelago and North-western Australia; a single species has lately been received from tropical Africa.

Tropidonotus quincunciatus et umbratus, Schleg. Phys. Serp. ii. pp. 307, 309. *Russell, Ind. Serp.* i.

Hydrus piscator et palustris, Schneid. Amph. pp. 247, 249.

Coluber anastomosatus, braminus, et umbratus, Daud. Rept. pp. 140, 144, & 176.

C. rectangularis, Gray. Ind. Zool.

C. hippus, Reuss. Mus. Senckenb. i. p. 150. pl. 9. fig. 2.

T. umbratus, Cantor, Mal. Rept. p. 89.

T. quincunciatus, Dum. & Bibr. vii. p. 592. *Gunth. Colubr. Snakes,* p. 64.

The coloration varies exceedingly; but there are generally two oblique black streaks behind the eye; the belly is white each ventral having a more or less distinct blackish anterior margin. The ground-colour of the upper parts is generally greyish or brownish olive. This is one of the most widely spread species of the East Indies, ranging from Mesopotamia into the southern parts of China, and inhabiting most of the islands of the western half of the Archipelago. It abounds near rivers and pools, feeding on frogs and fishes; it attains to a length of 3 feet, and is of fierce habits.

Tropidonotus annularis, Hallowell. Proc. Acad. Nat. Sc. Philad. 1856, p. 151. *Gunth. Colubr. Snakes,* p. 67.

T. chinensis, (Zan.) Berth. Gott. Nachr. 1859, p. 180. Back uniform lead-coloured; belly red

(white in spirits), with black cross bands each occupying one or two ventral or subcaudal shields, frequently interrupted in the middle. Found in Ningpo, and Chikiang in China and on the island of Formosa; length more than 30 inches.

Tropidonotus trianguligerus, *Reinw. Boie, Isis*, 1827, p. 535. *Schleg. Phys. Serp.* ii. p. 311. Upper parts uniform blackish brown, sides lighter, and on the anterior part of the body yellowish (probably red during life). Found in Java, Sumatra, Borneo and Penang. Length about 30 inches.

Tropidonotus macrophthalmus.
Xenodon macrophthalmus, *Gunth. Col. Snakes*, p. 58.

Brown or blackish brown above, uniform or with a dorsal series of reddish-brown spots; neck with an indistinct arrow-shaped mark. Anterior part of the belly with large quadrangular blackish-brown spots, posterior part and lower side of the tail more or less clouded with brown. This species may be at once distinguished by its large eye and by its dilatable neck, the scales of which show an arrangement very similar to that of a cobra, for which it is frequently taken. Found in Khasya and Sikkim—in the latter country at an elevation of 4,000 feet. Attains to 39 inches, the tail measuring 7 inches.

Tropidonotus dorsalis.
Xenodon macrophthalmus, spec. f. *Gunth. Colubr. Snakes*, p. 58.

Brownish grey, with a vertebral series of about twenty-five rhombic reddish spots, each occupying about four scales; belly with subquadrangular blackish spots anteriorly, and punctulated with brown posteriorly. From Chikiang; 24½ inches long, tail 4½ inches.

Tropidonotus macrops, *Blyth, Journ. As. Soc. Beng.* 1855, xxiii. p. 296. Darjeling, Sikkim and Nepal, 31 inches long, tail 6½ in.

Tropidonotus platyceps, *Blyth J. A. S. B.* 1855, xxiii. p. 297. *Gunth. Pr. Z. S.* 1860, p. 162. Nepal, Sikkim, Khasya, at 4,000 to 9,000 feet: 30 in. tail 8½ in. A coral red streak along the edges of the ventral shields.

Tropidonotus sub-minutus, *Sch. Ph. Serp. Blyth J. A. S. B.* 1855, xxiii p. 246.

Amphiesma sub-minutum *D. and B.* vii p. 734.

Indian continent, Khasya, Sikkim, Tenasserim, Siam, Cochinchina, Java, length 42 in. tail 10½ in. Belly white with an irregular series of black dots on each side.

Tropidonotus Himalayanus, chin and throat uniform yellow length 31 in. tail 8 in. Sikkim Nepal.

Tropidonotus angusticeps, *Blyth. Journ. As. Soc. Beng.* 1855, xxiii. p. 295. Colour (in spirits) plumbeous above, uniformly spotted with black throughout. Length of an adult 41 inches, tail 8½ inches. Assam and Arakan.

Tropidonotus stollatus, *Boie, Isis*, 1827, p. 535. *Schleg. Phys. Serp.* p. 317, *Cantor, Mal. Rept.* p. 90.

Coluber stollatus *Linn. Syst. Nat.* i. p. 379. *Amphiesma stollatus*, *Dum. & Bibr.* vii. p. 727, *Russell, Ind. Serp.* B. young.

Greenish or brownish olive, with numerous narrow, serrated or reticulated cross bars, intersected by two yellow or white longitudinal dorsal bands; Lower parts white. A male in the breeding-season, from Madras, is figured by Mr. Walter Elliott with the throat yellow, and with the ground-colour of the anterior part of the body red. This is perhaps the most common species of snake on the East Indian continent, ranging from Ceylon through the Peninsula along the southern slope of the Himalayas to southern China (Formosa); it is scarcer in the Malayan peninsula and the northern parts of Siam, and appears to be entirely absent in the Archipelago. It is of very gentle habits, feeding on small frogs; it attains to a length of 2 feet, but generally smaller.

Tropidonotus monticola

T. Monticolus, *Jerdon, Journ. As. Soc. Beng.* xii. p. 539. Common in the Wynnad, Anaimalay?

Tropidonotus juncus, *Cant. Mal. Rept.* p. 93.

T. dipsas, *Blyth, J. A. S. Beng.* 1855, xxiii. p. 297 & xxiv. p. 716.

Greenish olive above, with a series of well-defined rounded whitish spots along each side of the back; belly whitish, a black dot on each side of each ventral and subcaudal shield. Lips and throat gamboge; a gamboge band ascends obliquely from the angle of the mouth to the neck, joining its fellow at an acute angle; this band is less distinct in adult specimens than in young ones. Is of fierce habits and very ready to bite. Darjiling. Pinang hill, Chikiang.

Tropidonotus ceylonensis.

Tr. chrysargus, var. *ceylonensis*, *Gun. Cl. Sn.* p. 71.

Brownish-olive above; a series of about twenty yellow ocelli, edged with black, along each side of the body; the black edges are dilated into cross bands extending downwards to the side of the belly and upwards to the ocelli of the other side. 11 in. tail 2½ Ceylon.

Tropidonotus beddomii

Spilotes vittatus, *Beddome, Mad. Quart. Journ. Med. Sc.* vol. v.

Brown above; belly whitish, sides and the subcaudals dotted with brown. Neilgherries.

Tropidonotus nigroclotatus, *Blyth, Journ. As. Soc. Beng.* 1856, xiv. p. 717. Olive-grey above, passing into bright green towards the head, and conspicuously marked throughout with a series of about fifty narrow transverse black bands. Lower parts white. Length 26½ inches, of which the tail 6½ inches. Appears to inhabit either Pegu or Tenasserim.

Tropidonotus flavipunctatus.

Amphiesma flavipunctatum, *Hallowell, Proc. Acad. Nat. Sc. Philad.* 1860, p. 503.

Hongkong, Canton River. Length 21½ inches, of which the tail is 6½ inches.

Tropidonotus zebrinus, *Blyth, Journ. As. Soc. Beng.* 1855, xxiii. p. 295. Upper parts (in spirits) deep plumbeous obscurely spotted with black. Length of young specimen 10½ inches, of which the tail measures 8½ inches. Mergui.

Tropidonotus tigrinus: *Boie, Isis*, 1826, p. 206. *Schleg. Phys. Serp.* ii. p. 315, and *Faun. Japon, Ophid.*

Amphiesma tigrinum, *Dum. & Bibr.* vii. p. 732.

Tr. lateralis, *Berthold, Gott. Nachr.* 1859, p. 180.

T. orientalis, *Günth. A. & M. Nat. Hist.* Jan'y. 1862.

Greenish or brownish olive. Belly with a series of rounded small black spots anteriorly, nearly entirely black posteriorly; neck with an oblique black spot on each side. A black spot below the eye, on the suture between the fourth and fifth labials; a black blotch on the temple descending obliquely to the angle of the mouth. This is the representative of the European *T. natrix* in Japan and Northern China, and attains to the same size.

Tropidonotus leucomelas. Black above, with twenty-three very narrow white rings round the trunk; head uniform greenish olive; 8 inches long, the tail measuring 1½ inch. It is said to be from Pinang.

Tropidonotus plumbicolor. *Cantor, Proc. Zool. Soc.* 1839. p. 54.

Xenodon viridis, *Dum. & Bibr.* vii. p. 73. *Günth, Colubr. Snakes*, p. 57.

Dirty greenish: the upper parts being uniform dirty green, the lower whitish. Not uncommon in the Madras Presidency, and frequently enters houses; it attains to a length of 25 inches, the tail measuring 3 inches.

Atretium, Cope, Proc. Acad. Nat. Sc. Philad. 1861, p. 299. Body cylindrical, rather stout; head narrow; eye of moderate size, with round pupil. The anterior frontals are united into one triangular transverse shield, which is in contact with the rostral. The other shields of the head are regular. Two nasals; the nostril is in the upper part of the suture between them, but on the side of the head. Scales rather short, rhombic,

keeled, in nineteen rows. Ventrals broad, rounded; anal bifid; subcaudals two-rowed. Teeth numerous, those of the maxillaries increasing in length posteriorly, forming a continuous series. Only one species is known, forming the transition from *Tropidonotus* to the true freshwater snakes.

Atretium schistosum.

Chitter, Russell, Ind. Serp. ii.

Coluber schistosus, *Daud. Rept.* vii. p. 132.

Tropidonotus schistosus, *Schleg. Phys. Serp.* ii. p. 319. *Cantor, Mal. Rept.* p. 91. *Dum. & Bibr.* vii. p. 596.

T. moustus et surgens, *Cantor, P. Z. S.* 1839, p. 54.

Tropidophis schistosus, *Gray, Viper. Snakes*, p. 69.

Upper parts uniform blackish olive; length more than 2 feet; Ceylon Southern India, Bengal Malay peninsula, Philippine Islands and Madagascar. *Cantor* says, that it is very fierce, and prepares to attack by raising the head 3 or 4 inches vertically from the ground, and that it has the power of flattening and laterally expanding the skin of the anterior part of the body, like *Naja*, but in a much slighter degree. Frogs and fishes form its food.

Xenochrophis, Glikr. Body cylindrical, rather stout; head narrow, elongate; eye with the pupil round. Nostril lateral, situated in the upper part of a single plate. Shields of the head regular. Scales keeled, in nineteen rows; ventrals rounded, anal bifid; subcaudals two-rowed. No conspicuously longer teeth; they are widely set, those in the middle of the maxillary series and those in front of the mandible being rather larger than the others. Only one species is known.

Xenochrophis cerasogaster.

Psammophis cerasogaster, *Cantor, Proc. Zool. Soc.* 1859, p. 52.

Tropidonotus cerasogaster. *Cantor, Mal. Rept.* p. 92. *Günth. Colubr. Snakes*, p. 79.

Brown above, sometimes uniform, with a pair of lighter dorsal bands, sometimes with indistinct quadrangular dark spots. Malay peninsula, Bengal, Assam, and Khasya, length above 2 feet, the tail measuring one-fourth. Not numerous. Very fierce, and attacks in a vertical attitude, but without expanding the anterior part of the body. It feeds on frogs and fishes.

Prymniodon, Cope. Form slender, head moderately distinct. Shields of the head normal: two nasals, a loreal one preocular. Scales keeled in nineteen series. Ventrals not angulated, about 150 in number, anal entire; Pupil round. Palatine teeth very little longer than pterygoids; maxillary teeth minute posteriorly, becoming much longer anteriorly; none grooved. Only one species is known.

Ptychocheilus chalybeus. Cope. *Proc. Acad. Nat. Soc. Philad.* 1860, p. 588. 12½ inches long, without tail, said to be from Siam. Olivaceous above, shading into leek-green upon the flanks, and greenish white upon the belly.

Family of Fresh Water Snakes—Homalopsidæ.

Body of moderate length, cylindrical or slightly compressed; head rather thick, broad, not very distinct from neck; tail strong, of moderate length, tapering, more or less prehensile and compressed at its root, especially in the males. Scales subequal in size, not much imbricate; ventrals rather narrow, sometimes bicarinate; anal bifid; subcaudals two-rowed. Eye small. The nostrils are situated anteriorly on the upper surface of the head, small, provided with a valvule; the nasals are much developed, so as considerably to reduce the anterior frontals in size, which, frequently, are confluent into a small single shield, or, if double, are very small, triangular. The other shields of the head also frequently deviate from the arrangement typical in the Colubrine snakes. Cleft of the mouth of moderate width. All the Indian freshwater snakes of this family have a grooved fang at the hinder extremity of the maxillary bone. They are thoroughly aquatic, and are only occasionally found on the beach; several of them even enter the sea, and in several points of their organization approach the truly marine snakes, with which they have been associated in Gray's system. They may easily be recognized by the position of the nostrils on the top of the snout, which enables them to breathe by raising but a very small part of their head out of the water; it is the same arrangement as that in the Crocodiles, Sea snakes, and other aquatic animals. Many have a distinctly prehensile tail, by means of which they hold on to projecting objects. Their food consists entirely of fish, and, in a few species of crustacea also. All of them appear to be viviparous, and the act of parturition is performed in the water. They do not grow to any considerable size, are of a gentle disposition, and their bite would be by no means dangerous. They will not feed in captivity, and therefore die after a short time.

Fordonia, Gray. Head depressed, short, broad, scarcely distinct from neck; body stout, cylindrical; tail rather short, tapering, longer in males than in females, thick and strongly compressed in the former. Cleft of the mouth of moderate width, not angularly bent behind. Eye small, with vertical pupil. The whole upper surface of the head is shielded. Nostril directed upwards, in the middle of a simple nasal shield.

Anterior frontal single, small, in contact with the rostral. Five upper labials; scales smooth, without apical groove in from twenty-five to twenty-nine series, those of the outer series with truncated apex in adult specimens. Ventrals rather narrow, the two or three last bifid; subcaudals two-rowed. Maxillary short, with three or four small teeth and with a longer grooved tooth behind; mandibular teeth very short. Viviparous. Only one or two species are known.

Fordonia unicolor. Gray, *Vip. Sn.* p. 77. ? *Homalopsis leucobalia*, Schleg. *Phys. Serp.* ii. p. 345. Schleg. & Müll. *Verhand. Nat. Gesch. Nederl. Overz. Bezitt.*, Rept. p. 61.

Hom. leucobalia, var., Cantor, *Mal. Rept.* p. 102. Uniform blackish ash above, the lower parts and the three outer series of scales whitish. Borneo, Ceram, and Pinang, common in fresh waters as well as for some distance out at sea. length 25 in. the tail measuring 3 in.; it is of sluggish, not fierce, habits. Feeds on crustacea. *Fordonia leucobalia*, Schleg.; from Timor, appears to differ in its coloration only, having white spots across the back.

Cantoria, Girard. Body subcylindrical, deeper than broad, and very much elongated. Tail moderate, thick at its base and conical posteriorly. Head depressed, continuous with the body; mouth moderate; eye very small. Anterior frontal single, in contact with the rostral. One loreal. Orbital plates constituting a complete circle around the eye. Scales moderate, smooth, shining, disposed in nineteen longitudinal series.

* *Cantoria elongata*.

Cantoria violacea, Girard, in *U. S. Exp. Herpet.* xx. p. 156. (not *Coronella violacea*, Cantor).

Reddish violet above, with transverse bands of small whitish dots, indistinct towards the tail; neighbourhood of Singapore: 50 in. long, tail measuring 6 in. *Coronella violacea* Cantor is a Simotes its ventral shields nearly a hundred less in number.

Cerberus, Cuvier. Head rather high, of moderate length and width; body cylindrical, its hinder part and the tail rather compressed. Cleft of the mouth wide, turned upwards behind. Eye small, with vertical pupil. Snout covered with shields, occiput with scales. Nostril situated on the upper side of the head between two nasals, the anterior of which is the larger, forming a suture with the corresponding nasal of the other side; two small triangular anterior frontals; eye surrounded by a ring of small orbitals, the superciliary being well developed posterior upper labials divided transversely into two. Scales keeled, in from twenty-one to twenty-five rows; ventrals of moderate

width; anal bifid; subcaudals two-rowed. Maxillary teeth in a continuous series, slightly increasing in length posteriorly, the last being grooved. Mandibular teeth longest in front, decreasing in strength and more closely set behind. Viviparous. This genus extends through the whole of India, from Ceylon to the north coast of Australia. Only one species occurs in British India.

Cerberus rhynchops. Russell, *Ind. Serp.* ii. p. 40.

Hydrus rhynchops, Schneid. *Hist. Amph.* i. p. 246.

Elops bomformis, Schneid. *Hist. Amph.* p. 301.

Cerberus obtusatus, Cuv. *Règne Anim.*

C. cinereus, Gray, *Zool. Misc.* p. 64, and *Viper. Snakes*, p. 64. Cantor, *Proc. Zool. Soc.* 1839, p. 54.

Homalopsis schneideri, Sch. *Pha. Serp.* ii. p. 341.

H. rhynchops, Cantor, *Mal. Rept.* p. 94.

Cerberus bomformis, D. & B. vii. p. 978.

Upper parts blackish ash, with irregular, more or less distinct black cross bars; the two or three outer series of scales yellowish. Lower parts whitish it inhabits the large islands of the East Indian Archipelago, Ceylon, the peninsula of India, Bengal, the Malay-an peninsula, and Siam; it is numerous in the Malayan rivers and estuaries, and occasionally along the sea-coast. Its usual size is between 2 and 3 feet, the tail being one-fifth of the total length; but it attains to nearly 4 feet. The female brings forth eight living young, 7-7 ½ inches in length.

Hypsirhina, Wagler. Head rather depressed; tail of moderate length, distinctly compressed at its root in the males. Cleft of the mouth of moderate width; eye small. The whole upper surface of the head is shielded. Nostril on the upper surface of the head, in a large nasal shield, the outer part of which is divided into two by a groove running outwards from the nostril; the nasals of both sides form a broad suture together behind the rostral; only a single anterior frontal; two posterior frontals. Scales smooth, without apical groove, in from nineteen to twenty-three series. Ventrals rather narrow; and bifid; subcaudals two-rowed. Maxillary with a grooved tooth behind. Viviparous.

Hypsirhina plumbea. Wagh. *Syst. Amph.* p. 170. Gray, *Zool. Misc.* p. 66.

Homalopsis plumbea. Boie. *Isis*. 1827, xx, p. 550. *Schleg. Phys. Serp.* ii. p. 346. Cantor, *Mal. Rept.* p. 101.

Coluber plumbeus, Eyd. and Gerv., *Voy. Favor*, v. p. 73.

Hypsirhina hardwickii, Gray, *Ind. Zool. Mis.* p. 67.

Brownish or greyish-olive above, uniform or with an irregular dorsal series of small black spots. This species is not common, but widely spread, inhabiting Java, Borneo,

Celebes, Formosa, the southern parts of China, Pachebone, and the Malayan Peninsula. It attains to a length of 21 inches, the tail measuring 2½ inches.

Hypsirhina enhydris, D. & B. vii. p. 946.

Mutta Pam, Ally Pam, Russ., *Ind. Serp.* i. p. 35.

Hydrus enhydris, Schneid. *Hist. Amph.* p. 245.

Hypsirhina aer, Wagler. *Syst. Amph.* p. 170.

Gray, *Viper, Snakes*, p. 72.

Coluber aer, Eydoux & Gerv., *Voy. Favor.* v. p. 74.

Hypsirhina trilineata, bilineata, et fureata, Gray, *Zool. Misc.* p. 66.

Homalopsis olivaceus, Cant., *Pr. Zo. Soc.* 1839, p. 99.

Homalopsis enhydris, Cantor, *Mal. Rept.* p. 99.

Brownish olive above, the three outer series of scales and the belly whitish; a blackish line along each margin of the belly. This species is found in most parts of the East Indies, in Java, Borneo, the Malayan Peninsula, on the coast of Tenasserim, in Siam, Bengal, China, and according to Jerdon, in Southern India; it attains to a length of 28 inches, the tail measuring 5½ inches. Cantor says "Numbers may be seen in rivers, as well as in irrigated fields and estuaries preying upon fishes, which, however, it refuses in a state of captivity."

Hypsirhina jagorii. Peters, in *Monatsber. Berl. Acad.* 1863, p. 245. Brownish grey above, many isolated scales black; many scales of the outermost series and the middle of the ventrals white. From Siam, it is 12½ inches long, without the tail.

Hypsirhina bennettii, Gray, *Zool. Misc.* p. 67.

Hyp. maculata, Dum. & Bibr. *Erpt. gén.* vii. p. 950.

Appears to be peculiar to China, and attains to a length of 21 inches, the tail measuring 3½ inches.

Hypsirhina chinensis. Gray, *Zool. Misc.* p. 73. From China. Blackish ash above, with irregular series of small black spots; belly whitish, clouded with blackish. Larger specimens 16½ in. long, tail measuring 2½ inches.

Ferania, Gray. Head short, thick; body stout, compressed; tail of moderate length; cleft of the mouth of moderate width; eye small, with vertical pupil. The whole upper surface of the head is shielded. Nostril on the upper surface of the head, in a large nasal shield, the outer part of which is divided into two by a groove running outwards from the nostril. The nasals of both sides form a broad suture together, behind the rostral; two very small anterior frontals. Scales smooth, without apical groove, in twenty-seven series. Ventrals rather narrow anal bifid; subcaudals two-rowed. Maxillary with a grooved tooth behind.

Ferania Sieboldii.

Homalopsis sieboldii, Schleg. *Phys. Serp.* p. 349, *Cant. Mal. Rept.* p. 98.

Trigonurus sieboldii, Dum. & Bibr. vii. p. 980.

White, with about thirty-two very large, rounded, brown, black-edged spots, the interspaces between them being narrow. Old examples have the head uniform brown. A rare species, from Bengal and from the Province Wellesley. It attains to a length of 25 inches, the tail measuring 4 inches.

Homalopsis. Kuhl. Head rather depressed, flat, triangular, distinct from neck; body stout, cylindrical; tail of moderate length, tapering. Cleft of the mouth wide, turned upwards behind. Eye small, with vertical pupil. The whole upper surface of the head shielded. Nostril situated on the upper surface of the head, in a single nasal shield, the outer part of which, however, is divided in two by a groove commencing from the nostril and running outwards. The two nasals form a broad suture together behind the rostral; anterior frontal single, small (exceptionally divided); eye surrounded by a ring of small orbitals, the superciliary being well developed. Posterior upper labials transversely divided in two or three. Scales striated and keeled, in from thirty-seven to forty-seven series; ventrals rather narrow; anal bifid; subcaudals two-rowed. Maxillary teeth sub-equal in size, the last being grooved; mandibular teeth longest in front, decreasing in strength and more closely set behind. Viviparous. Only one species is found in British India.

Homalopsis buccata, Kuhl. *Schleg. Phys. Serp.* ii. p. 337. Gray. *Viper. Snakes.* p. 67. Dum. & Bibr. p. vii. 968. *Cant. Mal. Rept.* p. 96.

Coluber buccatus, L. *Syst. Nat.* i. p. 377. Russell, ii. p. 39.

H. hardwickii, Gray, *Viper. Snakes*, p. 67.

H. semizonata, Bly. *J.A.S.B.* 1856, xxiv. p. 187.

Pythonia (1) *semizonata*, Bl. *l. c.* xxviii. p. 297.

Brownish olive, with narrow, rather irregular, greyish, black-edged cross bands. Found in Java, the Malayau Peninsula, and Gamboja; length 42 inches, tail 10 inches. They are sluggish in their movements, and on dry land very awkward; the young ones are very gentle, and the old but seldom bite. The female brings forth six or eight living young at a time, each between 7 and 8 inches in length.

Hipistes, Gray. Head short, depressed, distinct from neck; rather slender; body of moderate length; tail stout, compressed, tapering. Cleft of the mouth of moderate width, somewhat turned upwards behind; eye very small, directed upwards, with vertical pupil. The whole upper surface of the head is shielded: nostril on the upper surface of the head, in a single nasal shield, the outer part

of which, however, is divided into two by a groove running outwards from the nostril. The nasals are separated from each other by a single narrow anterior frontal shield, which forms a suture with the rostral; two posterior frontals. Scales smooth, in thirty-nine series. Ventrals rather narrow, divided into three portions by a pair of sharp lateral ridges, the central portion being much the largest; anal bifid; subcaudals two-rowed. Maxillary with a grooved tooth behind; two or three strong teeth in the palatine series. Only one species is known, viz.

Hipistes hydrinus.

Homalopsis hydrinus, Cantor, *Mal. Rept.* p. 104.

Hipistes fasciatus, Gray. *Viper. Snakes*, p. 78.

Bitia hydroides, Gray, *l. c.* p. 63.

Pale-ash-coloured above, with a few blackish specks on the neck, and with about forty-eight black cross bars on the back of the trunk and tail, each about half as wide as the interspaces of the ground-colour. Lower parts white. This appears to be a semipelagic species, resembling a true *Hydrophis* in general appearance and colours; two were captured in fishing-stakes placed in the sea off the shores of Kedah; a third was washed on shore by the waves on the coast at Pinang. The largest male was 19 $\frac{3}{4}$ inches long, the tail measuring 2 $\frac{3}{4}$ inches. It moved actively and without difficulty on the sand, and did not offer to bite. In one examined the stomach contained remains of two small pelagic fishes. It appears to be a scarce snake.

Herpeton, Erpeton, Lacépède, Head depressed, of moderate length, distinct from neck; snout terminating in two flexible, cylindrical, scaly tentacles; body and tail rather stout, rounded. Cleft of the mouth of moderate width, turned upwards behind. Eye small, with vertical pupil. Head shielded above, with the occipitals well developed. Nostril on the upper side of the head, in the middle of a large nasal, the outer portion of which is divided by a groove running outwards from the nostril. The nasals form a broad suture together; two small triangular anterior frontals; lateral shields of the head very small; eye surrounded by a ring of small orbitals, the superciliary being well developed; upper labials small; chin-shields small, narrow, oblique. Scales strongly keeled, in thirty-seven series; ventrals very narrow, each with two keels; anal bifid; subcaudals not differing from scales. Maxillary with the last tooth grooved.

Herpeton tentaculatum, Günth, *Pr. Z. Soc.* 1860, p. 114. A. & M. N. Hist. 1861, viii. p. 266.

Erpeton tentaculé, Lacép. *Bull. Sci. Soc. Philom.* 1800, ii. p. 169.

Erp. tentaculatus, Latr. *Hist. Rept.* v. p. 190.

Homalopsis herpeton, *Schleg. Abbild.* p. 50.

The ground-colour of the broad back is brown or olive-brown, bordered on each side by a black line, which becomes indistinct posteriorly, and is more conspicuous in young specimens; found hitherto in the southern parts of Siam only, and it appears to be a local species even there. It is an aquatic snake; and its tentacles are probably employed as organs of touch, under water, perhaps to discern its food, the nature of which is not known. The largest specimen known is 25 inches long, the tail measuring 6 inches.

Family, of Desert Snakes.—*Psammophidæ*.

Body and tail generally elongate, sometimes stout-rounded; head very distinct from neck, narrow or thick, with the loreal region very concave. Scales smooth, in fifteen, seventeen, or nineteen rows; subcaudals two rowed. Cleft of the mouth wide; nostril lateral; eye of moderate size, with round or vertical pupil. Shields of the head normal: posterior frontals rounded or angular behind; vertical narrow, superciliaries prominent; loreal present; one præ, two post-oculars. One of the four or five anterior maxillary teeth is longer than the others, and the last is grooved. Most of the species of this family belong to the fauna of tropical Africa, which also produces a slender form *Psammophis elegans*.

Psammophis, *Boie*. Body and tail elongate; head with a rather long and pointed snout; loreal region concave, superciliaries prominent; Shields of the head regular: vertical long and narrow; loreal elongate. Scales lanceolate, smooth, flat, in from fifteen to nineteen rows. Anal bifid; pupil round. Maxillary with the fourth or fifth tooth elongate, and with the last tooth grooved; front teeth of the lower jaw long. One species of this African genus is found in British India.

Psammophis condanarus, *Blyth, Journ. As. Soc. Beng.* 1855, xxiii. p. 293.

Condanarouse, *Russeli, Ind. Serp.* i. p. 32.

Coluber condanarus Merr. Tentam. p. 108.

Psammophis tæniata, *Gunth. Ann. & Mag. Nat. Hist.* 1862, ix. p. 126.

Leptophis? bellii? *Jerdon Journ. As. Soc. Beng.* xxiii. p. 529.

Psammophis indicus, *Beddome, Madr. Quart. Journ. Med. Sci.* vol. v.

Back brown, with a black edge along each side. Belly yellow, with a black line along each side. Nulla Mulla Hills (Kurnool District). Ganjam; Chillianwallah; Length 40 inches, tail measuring 8½ inches.

Psammodynastes, *Gthr.* Body and tail rather stout; head with the snout short, and with the front part of the lips swollen; loreal region concave, superciliaries prominent.

Shields of the head regular; anterior frontals very small; vertical, narrow, elongate; one nasal, pierced by the nostril. Scales short, rhombic, smooth, without apical groove, in seventeen rows; anal entire. Pupil elliptic, erect. Anterior teeth in both jaws long, posterior maxillary tooth grooved. Only two species are known, one of which occurs in British India.

Psammodynastes pulverulentus, *Gunth. Colubr. Snakes*, p. 140.

Psammophis pulverulenta, *Boie, Isis*, 1827, p. 547. *Schleg. Phys. Serp.* ii. p. 211.

Dipsas ferruginea, *Cantor, Proc. Zool. Soc.* 1839, p. 53. *Blyth, Journ. As. Soc. Beng.* xxiii. p. 293; xxiv. p. 715.

The whole snake is sometimes black; sometimes a broad dark band runs along the side of the body,—the back, above the band, being of a lighter coloration. This snake has a very repulsive aspect: its dark, undefined colours, short and thick head, and swollen lips, caused by large hidden fangs, give it the appearance of a venomous snake; the largest specimen only 21 inches, the tail measuring 4½ inches. Khasya, Sikkim, Assam, Pegu, Mergui, Cochin-china, Sumatra, Java, and the Philippine Islands.

Family of Tree Snakes.—*Dendrophidæ*.

Body and tail much compressed or very slender and elongate; head generally elongate, narrow, flat, depressed, distinct from the slender neck; snout rather long, obtuse or rounded in front; cleft of the mouth wide; nostril lateral; eye of moderate size or large, with round pupil. Shields of the head normal. Scales generally narrow and much imbricate; ventral shields generally with two keels, rising on the sides; subcaudals two-rowed. No large fang either in front or in the middle of the upper jaw. The snakes of this family are diurnal species, living in trees, and feeding chiefly on tree-lizards; they are found in all the tropical regions. The Indian species belong to the following genera;

Gonyosoma, *Wagler*. Body and tail elongate, strongly compressed, with more than 200 keeled ventral shields; head flat above, with the snout more or less elongate, distinct from neck; eye of moderate size, with round pupil. Shields of the head regular: loreal sometimes absent; one anterior, two posterior oculars; two nasals. Scales not much elongate, smooth or very faintly keeled. Anal bifid. Teeth subequal in size, none grooved. The species known are East Indian.

Gonyosoma oxycephalum, *D.&B.* vii. p. 213.

Coluber oxycephalus, *Boie, Isis*, 1827, p. 537.

Gonyosoma viride, *Wagl. Icon.*

Herpetodryas oxycephalus, *Schleg. Phys.* p. 189 and *Abbild.* *Cantor, Mal. Rept.* p. 80.

Alopecophis chalybæus. Gray, *Ann. & Mag. Nat. Hist.* 1849, iv. p. 247.

? *Aepidea robusta*, *Hallowell, Proc. Acad. Nat. Sci. Philad.* 1860, p. 488.

Sea-green, paler below, sometimes entirely green. This snake occurs in many of the large islands of the Archipelago—Java, Celebes, Borneo, the Philippines,—at Pinang, and in Tenasserim. Length 82 inches, the tail measuring 19 inches.

Gonyosoma gramineum. Probably from Khasya. 14½ inches long, the tail measuring 3½ inches.

Gonyosoma frænatum, *Gunth. Col. Sn.* p. 123. *Herpetodryas frenatus*, *Gr. A. & M. N. H.* 1853, p. 390.

A black band runs from the loreal region through the eye to the angle of the mouth. The only specimen known is from Khasya; 27½ inches, the tail measuring 7½ inches.

Phyllophis, Gthr. Body and tail moderately elongate, strongly compressed, with more than 200 keeled ventral shields. Snout not depressed, of moderate length; supraciliary rather prominent; head distinct from neck; eye of moderate size, with round pupil. Shields of the head regular: two anterior and two posterior oculars; one nasal. Scales not much elongate, keeled, in twenty-three rows. Anal bifid. Teeth sub-equal in size, none grooved. Only one species.

Phyllophis carinata. Upper parts uniform greenish olive (?); said to be from China; 21 inches long, the head measuring 10 lines, and the tail 4½ inches.

Dendrophis, Boie. Body and tail very elongate, slender, compressed; head rather depressed, oblong, with the snout obtusely rounded in front. Eye rather large, with round pupil; nostril lateral, between two nares. Shields of the head regular. Scales smooth, in thirteen or fifteen rows, those of the vertebral series more or less enlarged, triangular or polygonal; the other scales much imbricate and elongate, narrow, quadrilateral. Ventral shields keeled; anal bifid. Posterior maxillary teeth not enlarged or grooved. The genus *Dendrophis* has been formed to comprise those tree snakes which combine an isodont dentition with an obtuse snout and enlarged, smooth vertebral scales.

Dendrophis picta. *Schleg. Phys. Serp.* ii. p. 228. *Gunth. Colubr. Snakes*, p. 148.

Coluber pictus, *Gm. Syst. Nat.* i. p. 1116. *Russell, Ind. Serp.* ii.

Coluber decorus, *Shaw, Zool.* iii. p. 538.

Leptophis maniar, *Bell, Zool. Journ.* ii. p. 329.

Ahaetulla bellii, *Gray, Ind. Zool.*

Dendrophis boii, *Cant., Pr. Zool. Sc.* 1839, p. 53.

Leptophis pictus, *Cantor, Mal. Rept.* p. 83.

Bronze or brown above, sometimes with a yellow vertebral line on the front part of

the trunk. This tree-snake is one of the most common species in almost every part of the East Indies. Its food consists of lizards and frogs. When old it is rather ferocious and bites readily; length 4 feet, the tail being not quite one-third.

Dendrophis caudolineata, *Gunth. Col. Sn.* p. 150.

Ahaetulla caudolineata, *Gray, Ind. Zool.*

Leptophis caudolineatus, *Cant. Mol. Rept.* p. 85.

Dendrophis ocellineata, *Dum & Bibr.* vii. p. 201.

D. picta, *Motley & Dillwyn, Labuan*, p. 46.

Light brownish bronze with two black bands running from a short distance behind the head along the lower parts of the side to the tip of the tail. Pale yellow beneath; a black line along the middle of the lower surface of the tail. This species is found at Pinang, Singapore, and in Borneo, and attains to a length of 5 feet, the tail being one-fourth.

Chrysopéelea, Boie. Body and tail very elongate and compressed oblong, with the snout obtusely rounded in front.

Chrysopéelea ornata, *Russell, Ind. Serp.* 1 and 2 *D. & B.* vii. 1042; *Gunth. Cat. Col. Sn.* p. 146.

Leptophis ornatus, *Cantor, Malay Rep.* p. i.

Dendrophis ornata, *Schl. Ph. Sep.* p. 234.

D. paradisei, *Motley and Dillwyn. Labuan*, p. 46.

This species has six varieties, it is the most beautiful of all snakes. Himalaya, Khasya, China, Malaya, E. Archipelago. It is very gentle.

Chrysopéelea rubescens, *Gunth. Col. Sn.* 165.

Dipsas rubescens, *Gr. Ind. Zo.*

Leptophis rubescens, *Blyth, J. A. S. B.* 1835, xxiii. p. 293.

Purplish above and below, minutely dotted with brown; and with irregular black specks, when old nearly uniform greyish yellow. Length 30 in. tail 9 in. Philippines, Sumatra.

Family of Whip Snakes,—*Dryophidae*.

Body and tail generally excessively slender and elongate, head very narrow and long with tapering snout. Asiatic species have a long fang like tooth in the middle of the maxillary and all are provided with a posterior grooved tooth.

Tropidococcyx, Gth. Body and tail rather slender slightly compressed.

Tropidococcyx perotteti, *Gunth. A. M. N. H.* 1850.

Psammophis perotteti, *D. & B.* vii. p. 398.

Leptophis Canariensis, *Jerd. J. B. A. S.* 1155, xxii. 530.

Dryiophis tropidococcyx, *Gunth. Col. Sn.* 147.

Common in N. Canara. Length 24 in. tail 5½ in.

Tragops, *Wagl.* Body and tail exceedingly slender, tail compressed.

Tragops prasinus, *D. & B.* vii. 826.

Trag. nasutus. *Wagl. Syst. Amph.* 184.
Dryiophis prasina, *Boie. Isis* 1827 & 525.
Dryinus nasutus, *Bell. Zo. Journ.* iii. 327.
Dr. prasinus, *Cantor. Mal. Rept.* 18.
 Ground colour, in some green in others, yellow; all have a yellow or white line running along the ventral shields. Ceylon, Bengal China and Archipelago.

Tragops dispar, *Gunth.* Males bright green, females bronza coloured. Avamally.

Tragops fronticinctus, *Gth.*
Dryiophis fronticinctus. *Gunth. Col. Sn.*
 Uniform grass-green above, paler below with a yellow band along each side of the belly, E. Indies, 10½ in.

Passerita Gray. Body and tail exceedingly slender, slightly compressed; head depressed, very long, with the snout long, pointed, and terminating in a flexible appendage; præorbital region deeply concave, with a projecting edge above. Eye of moderate size, with horizontal pupil; nostril small, lateral, situated in the hinder part of a single nasal shield. Shields of the head regular; loreal none. Scales smooth, elongate, narrow, much imbricate, in fifteen rows, those of the vertebral series larger than those on the side. Ventral shields not keeled; anal bifid. Maxillary with a strong tooth in the middle and with a grooved tooth behind.

Passerita mycterizans, *Gr. An. Ph.* x. p. 208.
 ? *Coluber mycterizans*, *L. Mus. Ad. Fried.* p. 28.
Russell, Ind. Serp. i.
Dryinus nasutus, *Morr. Tent.* p. 136 (not *Bell.*).
Dum. & Bibr. vii. p. 809.
Dryiophis nasuta, *Schleg. Phys. Serp.* ii. p. 246.
 Bright grass-green, with a bronze shade on the back. Ceylon, the peninsula of India; also said to be from Khasya, Sumatra Java, Celebes, and the Philippine Islands but these last are more or less suspicious.

Passerita purpurascens.
Passerita mycterizans, var. *Dryinus fuscus*, *Gunth. Colubr. Snakes*, p. 161 (not *Dum. & Bibr.*).
P. fusca, *Cope, Proc. Acad. Nat. Sc. Philad.* 1860, p. 554. *Tennent, Nat. Hist. Ceylon.* p. 307.
 Brownish grey, marbled with purple and dotted with brown, above and below. Peculia to Ceylon; rare, attaining to a length of 4 feet the tail measuring 1½ foot.

Family of Dipsades.—*Dipsadidae*.

Body much compressed, elongate or of moderate length; head short, generally broad behind subtriangular, with rounded, short snout, distinct from neck; eye large, generally with vertical pupil; nostril lateral. Shields of the head regular; cleft of the mouth wide; lower jaw expandible, with a mental groove. Scales generally smooth, those of the vertebral series frequently enlarged. Maxillary bone and its teeth

well developed: all the Indian species with a rooved fang behind; and several, moreover, with fangs in front. The Indian dipsades are nocturnal Tree Snakes with a vertical pupil, a short, broad head, and compressed, elongate body.

Dipsas auct. Body and tail much elongate and compressed; head depressed, triangular, short, broad behind, very distinct from neck; snout short. Eye rather large, with vertical pupil; nostril between two nasals. Shields of the head regular; loreal present. Scales smooth, more or less narrow on the sides, those of the vertebral series dilated. Anal entire; subcaudals two-rowed. Posterior maxillary tooth grooved.

Dipsas cynodon *Cuv. Regne Anim. Schleg. Phys. Serp.* ii. p. 268. *Cantor, Mal. Rept.* p. 77.
Endipsas cynodon, (*Fitz.*) *Gunth. Col. Sn.* p. 168.
Paras wandersii, *Bleek. Nat. Tydschr. Nederl.* ind. 1860, xx. p. 470.

Dipsas forsteni.
Triglyphodon forsteni, *D. and B.* p. vii. p. 1077.
 Anamallay, Malay Peninsula and E Archipelago.

Dipsas boops, *Gunth. Colubr. Snakes*, p. 170.
Dipsas fuscus, *Motley, & Dillwyn, Nat. Hist. Labuan*, p. 43. Bengal.

Dipsas dendrophila (*Reinw.*) *Wagl. Syst. Amph.* p. 181, and *Icon. Schleg. Phys. Serp.* p. 263, and *Abbild. Cantor, Mal. Rept.* p. 76.
Motley & Dillwyn, Labuan, p. 47. *Gunth. Colubr. Snakes*, p. 169.

Triglyphodon dendrophilum et gemmicinctum, *Dum & Bibr.* vii. pp. 1086, 1091.

This belongs to the fauna of the East India Archipelago extends to the Malayan Peninsula, Singapore, and Penang. It attains to the large size of 7 feet, the tail being rather less than one-fourth.

Dipsas bubalina. *Seba*, ii. p. 37.
Vipera bubalina, *Klein, Tent. Herpet.* p. 21.
Triglyphodon cyaneum, *Dum & Bibr.* vii. p. 1079.
Dipsas nigromarginata, *Blyth, Journ. As. Soc. Beng.* xxiii. p. 294.

Said to be from China. According to Blyth, it is an inhabitant of Assam. 53 inches long, the tail measuring 14 inches.

Dipsas hexagonotus, *Blyth Journ. As. Soc. Beng.* 1856, xxiv. p. 360; bright ruddy ferruginous inclining to coral red, paler below and mottled with black, bordering some of the scales of the upper parts. Calcutta.

Dipsas multimaculata, *Schleg. Phys. Serp.* i. p. 265, and *Abbild. Cantor, Mal. Rept.* p. 76.
Russell, Ind. Serp. ii. Reddish olive, with a series of round brown spots. Bengal, Tenasserim, the Malay Peninsula, Pinang, Siam, Java, Celebes, and China; length 2½ feet, the tail being one-fifth. The remains of birds in the stomach.

Dipsas trigonata, *Boie, Isis*, 1827, p. 559; *Schleg. Phys. Serp.* ii. p. 267. *Russell, Ind. Serp.* i.

Coluber trigonalis, *Schneid. in Bechst. Uebers. Lacer.* iv.

Dipsadomorphus trigonatus, *Fitz. Gunth. Colubr. Snakes*, p. 175.

Common in the Peninsula of Southern India, Bengal and to the foot of the Himalaya, attains to a length of about 3 feet, the tail being one-fourth. It feeds on mice.

Dipsas multifasciata, *Blyth, Journ. As. Soc. Beng.* 1861, xxix. p. 114. *Subathoo*.

Dipsas gokool, *Gray, Ind. Zool.*

D. cynodon, *Cantor, Mal. Rept.* p. 77 (the young specimen).

Yellowish brown, scarce, Pinang, Bengal. Larger specimens 33 inches long, tail measuring 7 inches; feeds on mice.

Dipsas ceylonensis.

Dipsadomorphus ceylonensis, *Gunth. Colubr. Snakes*, p. 176.

Greyish olive, minutely punctulated with black.

Family of *Lycodontes*.—*Lycodontidae*.

Body generally of moderate length or rather slender, rounded or slightly compressed; head of moderate length and width, generally with depressed, flat, and elongate muzzle. Eye rather small, generally with vertical pupil. Shields of the crown of the head regular, with the posterior frontals enlarged. Maxillary with a fang in front, but without a posterior grooved tooth. The Indian species, having a vertical pupil, would appear to be nocturnal snakes.

Lycodon. *Boie*. Body and tail of moderate length, slightly compressed; generally a slight ridge along the side of the belly and tail. Head depressed, with flat, obtuse snout, distinct from neck. Number of ventrals between 150 and 250. Nostril between two shields. Shields of the head regular; loreal present; one or two præ- and two post-oculars. Scales smooth, in seventeen rows. Subcaudals two-rowed; anal entire or bifid. Pupil elliptical, erect. Maxillary with one of the anterior teeth enlarged, there being a toothless space behind it; posterior maxillary tooth enlarged, not grooved; anterior mandibular teeth longer than the following; palatine teeth not enlarged. This genus is entirely composed of Indian species.

Lycodon aulicus, *Boie, Isis*, 1826, p. 981. *Cantor, Catal.* p. 68.

Coluber aulicus, *L. Syst. Nat.* i. p. 881. *Russell, ii. C. hebe, Seh. Pa. Sp.* ii. p. 106. (not *C. hebe*, *Daud.*)

One of the most common snakes of the Indian continent and Ceylon; it does not extend northwards to China, and becomes scarcer on the coasts of the south eastern parts

of India; it occurs in only a few of the islands—in the Philippines and in Timor; it is not certain whether the Javan form is specifically the same. It attains to a length of more than 2 feet, the tail being one-sixth. It is of fierce habits and defends itself vigorously.

Lycodon laoensis. *Gunth.* Deep black above, with pure-white cross-bands: lower parts uniform white. From the Laos Mountains, a male and female, are perfectly alike, and having a considerably shorter and narrower snout than *L. aulicus*; this character, combined with the peculiar coloration, indicated a specific difference. The male is 16½ inches long, the tail measuring 3½ inches.

Lycodon striatus. *Russell, Ind. Serp.* i.

Coluber striatus, *Shaw, Zool.* iii. p. 527.

C. malignus, *Daud. Rept.* vii. p. 45.

Appears to be confined to the peninsula of India, the Anamallay Mountains, the Madras Presidency; it does not grow to the same size as *L. aulicus*, the largest specimen seen being less than 2 feet, tail one-sixth of the total length.

Lycodon anamallensis. Greyish brown, with about twenty-five small, white, brown-edged cross bars on the back of the trunk; sides in distinctly reticulated with whitish; no collar; each labial with a brown spot. Lower parts uniform white, 20 inches long, the tail measuring 3½ inches.

Lycodon rufozonatus, *Cantor, Ann. & Mag. Nat. Hist.* 1842, ix. p. 483.

Coronella striata, *Hallowell, Proc. Acad. Nat. Sc. Philad.* 1856, p. 152.

Eumesodon striatus, *Cope, Ibid.* 1860, p. 268.

Crimson above, dotted and speckled with brown, Chusan; attains to a length of 40 inches, tail measuring 5½ inches.

Tetragonosoma, *Gthr.* Body and tail of moderate length, compressed, with rounded back and angular belly. Head depressed, of moderate length, with rounded snout, distinct from neck. Ventrals more than 200 angularly bent on each side. Nostril between two shields. Shields of the head regular: loreal none, replaced by posterior or frontal; one ante-, three (two) post-oculars. Scales smooth, without apical groove, in seventeen rows. Subcaudals two-rowed. Pupil elliptical, erect. Maxillary with one of the anterior teeth (third) enlarged, there being a toothless space behind it; palatine teeth not enlarged; mandible with a fang in front.

Tetragonosoma effrene, *Gunth. Col. Sn.* p. 253.

Lycodon effrenis, *Cantor, Mal. Rep.* p. 70.

Lycodon ophiteoides, *Bleek. Nat. Tydschr. Ned. Ind.* xvi. p. 486.

The Great Hill of Pinang; 12½ inches long,

tail measuring $2\frac{1}{2}$ inches, from Sinkawang (Borneo), 27 inches long, the tail measuring 6 $\frac{1}{2}$ inches.

Tetragonosoma atropurpureum.

Lycodon atropurpureus, *Cant. Pr. Z. S.* 1839, p. 50.

Deep purple, marbled with white and black; beneath pearl-coloured. Ventrals 257; subcaudals 91." Mergui.

Leptorhynchos, *Gthr.* Body of moderate length, rounded, not compressed; tail short; head depressed, of moderate length, with rounded snout, distinct from neck. Ventrals less than 200, not bent on the sides. One nasal shield, pierced by the nostril; loreal elongate, pointed behind, but scarcely coming into the orbit. One præocular, situated above the loreal; two postoculars. Scales smooth, with a minute apical groove, in seventeen series. Subcaudals two-rowed. Pupil elliptical, erect. Maxillary with a fang in front of the mouth, a toothless space behind it; a series of small teeth on the side, the last being stronger than the others. Palatine teeth not enlarged. Mandible with one or two fangs in front. Only one species is known.

Leptorhynchos jara, *Gunth. Col. Sn.* p. 205.

Jara-potoo, *Russell, Ind. Serp.* i.

Coluber jara, *Shaw, Zool.* iii. p. 525.

C. bipunctatus, *Cantor, Pr. Z. S.* 1839, p. 52.

Lycodon jara, *Schleg. Phys. Serp.* ii. p. 110.

Length $16\frac{1}{2}$ in. tail $2\frac{1}{2}$ in. Animalay, Ganjam, Bengal, Assam. Brown above, each scale, with two white dots, generally a white collar; lower parts uniform white.

Ophites, *Wagler.* Body and tail rather slender, compressed, with an angular ridge along each side of the belly and tail. Head depressed, with flat, obtuse snout, distinct from neck. Ventrals about 200 or more, angularly bent on each side. Nostril between two shields. Shields of the head regular: in one species præocular absent. Scales keeled, in seventeen rows. Subcaudals two-rowed. Pupil elliptical, erect. Maxillary with one of the anterior teeth (third or fourth) enlarged, there being a short toothless space behind it; last maxillary tooth and palatine teeth not enlarged; mandible with a fang in front.

Ophites subcinctus, *Wagl. Syst. Amph.* p. 186. *Russell, Ind. Serp.* ii.

Coluber platurinus, *Shaw, Zool.* iii. p. 468.

Lycodon subcinctus, *Boie, Isis*, 1827, p. 551, *Schleg. Phys. Serp.* ii. p. 117.

L. platurinus, *Cantor, Mal. Rept.* p. 69.

Black, paler on the sides and below. This is a Javan species, extending to Penang, where it is very scarce. It attains to a length of 3 $\frac{1}{2}$ feet, the tail being one-fourth or one-fifth of the total length. It feeds on skinks and is of fierce habits, like the other *Lycodontides*.

Ophites albofuscus, *Gunth. Col. Sn.* p. 207.

Sphecodes albofuscus, *Dum. & Bibr.* vii. p. 394.

Light reddish, with numerous (about fifty) brown cross bands, Malabar Coast, Sumatra; $24\frac{1}{2}$ inches long, the tail measuring $8\frac{1}{2}$ inches.

Cercaspis, *Wagl.* Body of moderate length, strongly compressed; tail rather short. Head rather depressed, flat above, with rounded snout of moderate length, not very distinct from neck. Ventrals not quite 200 in number, with a strong angular ridge on each side; subcaudals simple. Shields of the head regular. Scales strongly keeled, in nineteen series. Pupil elliptical, erect. Maxillary with one of the anterior teeth (third or fourth) enlarged, there being a toothless space behind it; the last maxillary tooth is larger than the preceding, and separated from them by an interspace. Palatine teeth not enlarged; the anterior mandibular teeth are not much larger than the following. Only one species, from Ceylon, is known.

Cercaspis carinata.

Hurria carinata, *Kuhl, Beitr. Zool.* p. 95.

Cercaspis carinatus, *Wagl. Syst. Amph.* p. 191.

Lycodon carinatus, *Schleg. Phys. Serp.* ii. p. 109.

Black; white rings encircle the body and the tail; it is not scarce in Ceylon, attaining to a length of 2 feet, the tail taking from 4 to 5 inches.

Family of Blunt-Heads—*Amblycephalidae*. Body much compressed, slender or of moderate length; its hinder portion and the tail prehensile; head short, thick, very distinct from neck; eye of moderate size, with vertical pupil; nostril lateral, in a single plate. Shields of the crown of the head sometimes increased in number. Cleft of the mouth much narrower than the external posterior commissure of the lips would indicate; lower jaw not expandible, covered with large unsymmetrical chin-shields, not separated by a mental groove. Scales smooth or faintly keeled, in from thirteen to fifteen series, those of the vertebral series enlarged. Maxillary bone very short, provided with only a few very small teeth; palate and lower jaw with strong teeth anteriorly; no grooved tooth.

Amblycephalus, sp., *Kuhl.* Body and tail slender, strongly compressed, prehensile; head thick and large, much elevated, with convex lips, very distinct from neck. Shields of the head irregular: rostral very high; two pairs of frontals of moderate size; an elongate vertical and supraciliaries; a pair of rounded occipitals; smaller shields are sometimes intercalated between those mentioned. Several loreals; a ring of small separate shields round the orbit; anterior labials, narrow, high; temporals numerous, scale-like. Scales

smooth, thin, elongate, without apical groove, much imbricate, in thirteen series; those of the vertebral series exceedingly large, hexagonal. Ventrals rounded, less than 200 in number; anal and subcaudals simple. Teeth few in number: a long fang anteriorly in the palate and in the lower jaw.

Amblycephalus boa, (Kuhl.) Boie, *Isis*, 1828, p. 1035.

Dipsas boa, Schleg. *Phys. Serp.* ii. p. 28. Cantor, *Mal. Rept.* p. 78.

The head of this most singular snake resembles much that of a mastiff, the lips, being arched and tumid; it climbs with great facility, frequenting the roofs of the huts of the natives in pursuit of its food, which consists of insects. It belongs properly to the fauna of the archipelago, inhabiting Java, Borneo, and the Philippine Islands; Cantor found it at Penang; it does not appear to be common anywhere. It readily bites; and attains to a length of 3 feet, the tail being one-third.

Pareas, Wagl.—Body strongly compressed of moderate length or rather slender; tail of moderate length, prehensile. Cleft of the mouth very short. Shields of the upper side of the head regular. Loreal present, or united with præocular. Scales smooth or faintly keeled, in fifteen series, those of the vertebral series largest. Ventrals rounded, less than 200 in number; anal simple; subcaudals bifid. Maxillary teeth small, few in number; palatine and mandibular teeth in a continuous series, gradually increasing in length towards the front.

Pareas carinata, Wagl. *Syst. Amph.* p. 181.

Dipsas carinata, (Reinw.) Schleg. *Phys. Serp.* ii. p. 285, and *Abbild.*

Greyish brown, with numerous closely-set, reticulated blackish cross bands; whitish below, with some irregular brown dots, not very rare in Java. From the Laos Mountains in Cochin-China. It attains to a length of 20 inches, the tail being one-fourth.

Pareas monticola.

Dipsas monticola Cantor, *Pr. Z. S.* 1839, p. 53.

Brown, yellowish below, irregularly dotted with brown.

Pareas lævis, Dum. & Bibr. vii. p. 442.

Amblycephalus lævis, (Kuhl) Boie *Isis*, 1827, p. 519.

Dipsas lævis, Schleg. *Phys. Serp.* ii. p. 287.

Brown or blackish ash marbled with black, the black colour being disposed in irregular cross bands; belly brown. This snake is found in Java, Cochin-China, (Lao Mountains) and Khasya. Longest specimen, is 16 inches the tail measuring 3 inches.

Family of Rock Snakes.—*Pythonidae*.

Body and tail of moderate length or rather

slender, rounded; tail prehensile: head with the snout rather long, depressed, truncated or rounded in front. Eye of moderate size, with vertical pupil. Scales smooth, in numerous series; subcaudals two-rowed. Some of the upper and lower labials are pitted. Teeth in the intermaxillary, maxillary, palatine, pterygoid, and mandibular bones, of unequal size; none are grooved. Adult individuals with a spur-like prominence on each side of the vent; it is the extremity of a rudimentary hind limb hidden between the muscles. The Rock-snakes are found in the hottest parts of Africa, Asia the East Indian Archipelago, and Australia. They climb as well as they swim; most of them prefer the neighbourhood of water. This family contains the largest snakes. Only one genus, the python, is found in British India.

Python, sp., Daud. The two species of Indian Rock-snakes are among the largest of living reptiles. Of snakes, only their African congeners and the American *Eunectes murinus* can be placed beside them. Their dimensions and their strength, however, have been much exaggerated: specimens of 18 to 20 feet in length are very rare, although isolated statements of the occurrence of individuals which measured 30 feet are on record and worthy of credit. Rock-snakes from 15 to 20 feet long have the thickness of a man's thigh, and will easily overpower a small deer, a sheep, or a good-sized dog. The Rock-snakes must attain to a considerable age. A *Python reticulatus* lived in the menagerie of the Zoological Society of London for fifteen years; when brought to England it was about 11 feet long, and in ten years it had attained to a length of 21 feet, after which no further growth could be observed. The males remain smaller than the females. The Rock-snakes will propagate in captivity—the Indian *P. Molurus* having bred in Paris, and the African *P. Sebae* in London. In both cases the eggs were incubated by the mother, and in the former successfully hatched.

Python reticulatus. Gray. *Zool. Misc.* p. 44. Dum. & Bibr. vi. p. 426. Cantor, *Mal. Rept.* p. 55. Seba, i. p. 98, ii. p. 83 and p. 85.

Boa reticulata, Schneid. *Hist. Amph.* p. 264.

Python schneiderii, Merr. *Tent.* p. 89. Schleg. *Phys. Serp.* ii. p. 415.

Ular-Sawa, Malay.

Ground-colour light yellowish brown, chestnut, or olive: This is a common species in the Archipelago, inhabiting almost all the islands. The fauna of the Malayan Peninsula bears as much the insular as the continental character, and appears to be the only part of the continent where this Rock-snake is found; according to Cantor it is numerous there and in the

neighbouring islands, feeding on quadrupeds and birds. It often takes up its abode in out-houses, preying at night, and is thus useful in destroying vermin, although plunder is occasionally committed in poultry-yards. When kept in captivity it is of importance to supply it with a small tank of water, in which it will frequently remain for days. Individuals of 16 feet in length are not of rare occurrence, and some about 30 feet long are on record.

Python molurus. Gray, *Zool. Misc.* p. 44. *Dum. & Bibr.* vi. p. 417. *Seba*, i. p. 59.

Coluber molurus, *L. Syst. Nat.* i. p. 225.

Peddapoda, *Russell, Ind. Serp.* i.

Python tigris, *Daud.* v. p. 241.

P. bivittatus (part.), *Schl. Ph. Serp.* ii. p. 403.

Ashdaha. *Hind. Pers.*

The ground-colour is light greyish brown. A dark-brown streak runs from the nostril through the eye to behind the angle of the mouth, gradually becoming broader and confluent with another band running along the lower jaw. Lower parts yellowish, brownish or blackish on the sides. This Python, commonly known under the name of "Rock Snake," and by some misnamed "Boa," is almost peculiar to the continent of India. Common in the Southern Peninsula and in Bengal, it extends northward into the Saul Forest at the foot of the Himalaya, and probably to Southern China. Its occurrence in the Malayan Peninsula is problematical, and in Java it is at all events much scarcer than *P. reticulatus*. Ceylon is inhabited by a Python, but it is not known whether it is *molurus* or *reticulatus*—probably the former. Specimens are known to have been captured which were 20 feet long, and it is probable that it attains to the same size as its congener from the Archipelago.

Family of Sand Snakes.—*Erycides*.

Body of moderate length, cylindrical, covered with small, short scales; tail very short, with a series of subcaudals; head with a broad snout of moderate length, or somewhat elongate. Eye rather small, with vertical pupil. None of the labials are pitted; cleft of the mouth wide; teeth in the maxillary on the palate, and in the mandible, none in the intermaxillary; the anterior teeth are the longest. Adult individuals with a short conical prominence in a groove on each side of the vent; it is the extremity of a rudimentary hind limb. The snakes of this family show great similarity to the Pythons and Boas with regard to their internal structure as well as to their external characters. But their tail is very short, not flexible, much less prehensile.

Gongylophis, *Wagl.* Head flat, oblong, scarcely distinct from neck, with the snout rather long and obtusely rounded in front, and

without canthus rostralis. Body cylindrical, of moderate length; tail very short, tapering. Nostril lateral, directed upwards; eyes rather small, with vertical pupil. Head covered with scales only the foremost part of the snout and the lips are shielded; scales small, keeled; ventrals and subcaudals narrow. Chin entirely covered with small scales, without medium groove. Anterior teeth in the jaws and on the palate longest.

Gongylophis conicus, *Wagl. Syst. Amph.* p. 192. *Gunth. Proc. Zool. Soc.* 1860, p. 163.

Russell, Ind. Serp. i. p. 5.

Boa conica, *Schneid. Hist. Amph.* ii. p. 268, and *Denkschr. Münch. Acad.* 1821, vii. p. 119.

Eryx conicus, *Dum. & Bibr.* vi. p. 470.

Brownish gray. Common in many parts of the Peninsula of India, Sikkim at 4,000 feet, Length above two feet.

Cursoria. *Gray*, distinguished from *Gongylophis* by its having smooth scales.

Cursoria elegans, *Gray, Viper, Snakes*, p. 107, tail short, tapering, eye very small, with vertical pupil, ventrals 184. Light brownish olive, with a dorsal series of irregular rounded, chestnut-brown black-edged spots. Numerous small brown spots along the side and belly. Afghanistan, about 16 inches long.

Eryx. *sp. Daudin*. Head not distinct from neck, with the snout obtusely conical, and with a sharp transverse anterior edge. Body cylindrical, of moderate length; tail very short. Nostril very narrow, lateral; eyes small, with vertical pupil; head covered with scales: snout shielded, scales small, slightly keeled. Chin with some small shields along the middle separated by a median groove.

Eryx johnii, *Dum. & Bibr.* vi. p. 458.

Boa johnii, *Russ. Ind. Serp.* ii. p. 18 and p. 20.

Clothonia johnii, *Gray, Zool. Misc.* p. 45. *Gunth. Proc. Zool. Soc.* 1860, p. 164.

E. maculatus, *Hallowell, P. A. N. S. Phil.* 1849, p. 184.

Upper parts reddish olive, uniform or with irregular small black spots and dots; lower parts generally marbled with blackish. This is a common species in the plains of the peninsula of Southern India; a large specimen, spotted all over with black, was brought from Sikkim by Messrs. von Schlagintweit, who fix the elevation at which it was captured at 9,800 feet above the level of the sea.

Family of Wart Snakes.—*Acrochordida*.

Body of moderate length, rounded or slightly compressed, covered with small, wart-like, not imbricate, tubercular or spiny scales; tail rather short, prehensile. Head rather small, not distinct from neck, covered with scales like the body. Eye small. Nostrils close together, at the top of the snout. Teeth short, but strong, subequal in size, in the jaws and on the palate. Viviparous.

Acrochordus, Hornstedt. The hind part of the body and tail are slightly compressed; tail not expanded by a fold of the skin. No ventral or subcaudal shields whatever; each scale with a strong triangular keel, terminating in a spine; many scales with another pair of smaller spines. Only one species is known.

Acrochordus javanicus, Hornst. Abhandl. Acad. Stockh. 1797, vii. p. 306. *Schleg. Phys. Serp.* ii. p. 424, and *Abbild.* p. 55. *Cantor, Mal. Rept.* p. 58.

Brown above, more yellowish on the sides. This snake is very rare, and has been found only in Java, at Pinang, and Singapore. It grows to a length of 8 feet, its habits are terrestrial.

Chersydrus, Cuv. The hind part of the body and the tail are slightly compressed; the surface of the latter is vertically expanded by a fold of the skin running along its lower side. No ventral or subcaudal shields whatever; a low fold of the skin runs along the median line of the abdomen. Scales with a short tubercle-like keel, not spiny. Only one species is known.

Chersydrus granulatus et annulatus, Gray, Viper. Snakes, p. 61.

Hydrus granulatus, Schneid Amph. p. 243.

Acrochordus fasciatus, Sh. Z. iii. pp. 11, 576.

Chersydrus fasciatus, Cuv. Règne Anim.

Acrochordus granulatus, Cant, Mal. Rept. p. 59.

Brownish black, with whitish cross bands on the sides and abdomen; head with some small yellowish spots. This is a thoroughly aquatic species, as is indicated by its broad, compressed tail, which, however, differs greatly from that of the Hydrohides in not having the processes of the caudal vertebræ prolonged. It is more or less scarce, but found in the rivers and on the sea coasts of numerous islands of the Archipelago, extending to New Guinea and the Philippines. It inhabits also the eastern coasts of Southern India and the Malayan Peninsula, and sometimes it may be seen three or four miles distant from the shore. It is not venomous, as has been stated by writers.

SECOND SUB-ORDER.

Ophidii Colubriformes Venenosi—Venomous Colubrine Snakes.

Snakes with an erect, immovable, grooved or perforated tooth in front of the maxillary.

Family of Elapides—Elapidæ.

Body cylindrical or sub-cylindrical; tail rather short, tapering; head with the normal number of shields above; loreal constantly absent. Nostril lateral. Eye rather small, with round pupil. The venom-fang shows a distinct groove along its front, and the canal in its interior terminates in a slit at its extremity.

Naja, Laur. Body and tail of moderate length; belly flat; head rather high and short not very distinct from neck, which is very dilatable, the anterior ribs being elongate. The shields of the head normal, but the loreal is absent. Nostril wide, lateral, between two shields; eye of moderate size, with round pupil. One præ-, three, sometimes two or four post-oculars. Six upper labials, the third and fourth entering the orbit; the third forms the lower half of the anterior margin of the orbit. Scales smooth, much imbricate, in numerous series round the hood. Anal entire; subcaudals two rowed. The fang is grooved, with a foramen at its extremity; one or two small ordinary teeth at a short distance behind it.

Naja tripudians, Merr. Tent. p. 147. *Gray, Ind. Zool. Schleg. Phys. Serp.* ii. p. 466. *Gunth. Colubr. Snakes,* p. 223.

Coluber naja, L. Syst. Nat. i. p. 382.

N. larvata, Cantor, Proc. Zool. Soc. 1839, p. 32. *N. atra, Cant. A. & M. Nat. Hist.* 1842, ix. p. 482. *N. kaouthia, Less. in Bélang. Voy. Ind. Orient. Zool.* p. 312, *Rept.*

Cobra or Naga.

Var. a. Uniform brownish olive above, with a pair of very conspicuous white, black-edged spectacles on the neck. Madras, Animallay, Dekhan, Bengal, Penang.

Var. β. Dark brown above, many scales with whitish edges, a pair of spectacles on the neck, white, black-edged; in old cobra, spectacles uniform black. Ventrals 195, sub-caudals 62. Ceylon.

Var. γ. Olive brown above with very conspicuous white, black-edged spectacles. Ventrals 174. China.

Var. δ. Uniform blackish brown above and below, head of a lighter colour. Ventrals 180. China.

Var. ε. Without spectacles, uniform blackish brown above, spectacles: variety from Dekhan, Sikkim and Penang. Ventrals 184-187.

Var. ζ. Uniform black. A large white ocellus on the neck with black centre and black margin. Ventrals 174. Siam.

Var. η. Black above and below. A large white ocellus on the neck with black centre. Ventrals 170. Siam.

Var. θ. Black above and below a large white ocellus on the neck with black centre and black edge. Ventrals 193, sub-caudals 53. Bombay, Calcutta, Assam, Sikkim.

All the varieties form but one species, which is widely spread, all over the East Indies,

N. sputatrix Reinwardts of the Archipelago, appears to be a distinct species. The true *Naja tripudians*, however, is also found in a number of the larger islands of the Archipelago. It extends eastwards to the Sulej, and westwards to the Chinese island of Chusan. Singularly, it has never been observed by Mr. Hodgson in the valley of Nepal, but occurs in different parts of the Himalaya, reaching an altitude of 8,000 feet in Sikkim. It is more a nocturnal animal than a diurnal one, and ovo-viviparous. Its chief enemies are the jungle fowl, which destroy the young brood, and the *Herpestes* or ichneumons, which will attack and master the largest Cobra: in districts where the Cobras or other venomous snakes have too much increased in number, the most efficient way of destroying them is to protect their natural enemies. The Cobra is the most common venomous snake of the East Indies.

Ophiophagus, Gthr. Body rather elongate; tail of proportionate length; head rather short, depressed, scarcely distinct from neck, which is dilatable. Occipitals surrounded by three pairs of large shields, the two anterior of which are temporals. Nostril between two nasals. Loreal none; one or two præ-, three post-oculars. Scales smooth, much imbricate, in transverse rows, in fifteen series round the body, but in many more round the neck; those of the vertebral series are rather larger than the others. Ventrals more than 200; anal entire; anterior subcaudals simple, posterior two rowed, sometimes all bifid. Maxillary with a large fang in front, which is perforated at the end, showing a longitudinal groove in front; a second, small, simple tooth at some distance behind the fang. Only one species is known.

Ophiophagus elaps.

Naja bungarus, Schleg. Phys. Serp. ii. p. 476, and in Verhand. Overz. Bezitt. Nederl. Ind. Zool. p. 71.

N. elaps, Schleg. Phys. Serp. ii. p. 485.

Hamadryas (hannah) ophiophagus, Cantor, As. Res. xx. p. 87. and Mal. Rept. p. 116.

Trimeresurus ophiophagus, D. & B. vii. p. 1245.

Hamadryas elaps, Günth. Colubr. Snakes, p. 219.

This remarkable snake is easily recognized by the large shields surrounding the occipitals. Although rather rare, it has a very wide geographical range: in almost every part of the Indian continent, the Andaman Islands, Java, Sumatra, Borneo, the Philippine Islands, and, according to Dumeril, also in New Guinea. It is one of the largest and most deadly venomous snakes, attaining to a length of more than 12 feet, of which the tail is about one-fifth. It inhabits hollow trees, and is sometimes found resting between the branches; it feeds on other snakes.

Bungarus, Daud. Body rather elongate; tail comparatively short; head more or less dilated, depressed, with broad, rounded muzzle, scarcely distinct from neck, which is not dilatable. Nostril between two nasals. Loreal none; one præ-ocular, two post-oculars. Scales smooth, moderately imbricate, disposed in oblique rows, forming fifteen longitudinal series round the body; those of the vertebral series are very broad, hexagonal. Ventrals between 200 and 250; anal and subcaudals entire. Maxillary with a fang in front, which is perforated at the end, showing a longitudinal groove in front; a second, small, simple tooth at some distance behind the fang. All the species occur on the continent of India. The name of the genus has been derived from a vernacular name, Bungarum, used on some parts of the coast of Coromandel. All the species known belong to the continental fauna, two of them extending to some of the islands of the Archipelago; the diagnoses given, although short, will be found fully sufficient to recognize and distinguish these closely allied species.

Bungarus cæruleus, Daud. Hist. Rept. v. p. 270. Dum. & Bibr. vii. p. 1273.

?? *Coluber candidus, L. Mus. Ad. Fried.*

Pseudoboa cærulea, Schneid. Hist. Amph. p. 284. Boa Krait, Williams, As. Res. ii. p. 328. Russell, Ind. Serp. i.

B. arenatus, Dum. & Bibr. vii. p. 1272.

B. lineatus, Günth. Colubr. Snakes, p. 219.

Rather common throughout the peninsula of Southern India, in Bengal, and in Assam, but not in Ceylon. It attains to a length of 54 inches, of which the tail takes about one-seventh.

Bungarus fasciatus, Cantor, Mal. Rept. p. 113.

Seba, ii. Russell, Ind. Serp. i.

Pseudoboa fasciata, Schneid, Hist. Amph. p. 283.

Bungarus annularis, Daud. Rept. v. p. 265. Schleg. Phys. Serp. ii. p. 457 and Abbild.

Lower parts and throat uniform yellow. This is the largest species of *Bungarus*, attaining to a length of 4 feet, the tail taking one-tenth of it. It has a wide range, but appears to be rather locally distributed; it has been brought from Java, from the Malayan Peninsula and Pinang, from the Tenasserim coast, from Bengal and China, and from the coast of Coromandel. Jerdon says that he has seen specimens only in the Northern Circars at Ganjam, where it is not very common.

Bungarus ceylonicus.

B. fasciatus, var. B. Günth. Colubr. Snakes, p. 221.

This species or variety is peculiar to Ceylon and not uncommon.

Bungarus semifasciatus, Kuhl. *Isis*, 1827, p. 552. *Schleg. Phys. Serp.* ii. p. 459, and *Abbild. Dum. & Bibr.* vii. p. 1271.

Aspidoclonion semifasciatum, Wayl. *Icon. Bungarus multiocinctus*, Blyth, *Journ. As. Soc. Beng.* 1861, xxix. p. 98.

China from the Island of Formosa. Length 4 feet, tail one-ninth of the total length. It feeds on lizards when young, and afterwards probably on small mammals.

Xenurelaps. Body subcylindrical, long and slender; belly rounded; head short, subtriangular, with rounded snout, not distinct from neck, which is not dilatable; tail short. The shields of the head normal, but the loreal is absent. Nostril lateral, between two shields; eye small, with round pupil, one præ-, two post-oculars. Scales smooth, not much imbricate, in fifteen rows; those of the vertebral series enlarged, hexagonal. Anal entire; subcaudals bifid. Maxillary with a grooved fang in front, and with a small smooth tooth behind. Only one species is known.

Xenurelaps bungaroides.

Elaps bungaroides, Cant. *Pr. Z. Soc.* 1839, p. 33.

Ventrals 237; anal entire; subcaudals 46.

Upper parts black, with narrow white, angular, transverse lines. Lower parts whitish, with irregular blackish cross bands. From Chirra Punji; it is 15½ inches long, the tail measuring 1½ inch.

Megærophis, Gray. Body elongate, tail of moderate length; head flat, depressed, with broad, rounded snout, scarcely distinct from neck, which is not dilatable. Nostril between two nasals. Loreal none; one præ-, two post-oculars. Scales smooth, moderately imbricate, in thirteen series, those of the vertebral series being very broad, hexagonal. Ventral shields about 225; anal and anterior subcaudals entire, the others bifid. Maxillary with a fang in front, which is perforated at the end, showing a longitudinal groove in front; a second small, simple tooth at some distance behind the fang. Only one species is known.

Megærophis flaviceps.

Bungarus flaviceps, Reinh. *Dansk. Vidensk. Afhand.* x. p. 253. *L. Cantor, Catal.* p. 112. *Günth Colubr. Snakes*, p. 221.

Megærophis formosus, Gray, *Ann. & May. Nat. Hist.* 1849, iv. p. 247.

Black, with a white vertebral line which becomes red posteriorly. Belly red in specimens from Borneo, black anteriorly and red posteriorly in specimens from Pinang. This snake has the structure of the head-shields and of the vertebral scales of a *Bungarus*; it is rare, and found in Borneo, Java, Sumatra, and at Pinang. It attains to a great length, the largest specimen measuring 6 feet and 1 inch, the tail being 9 inches long.

Callophis, Gray. Body subcylindrical, very long and slender; belly rounded; head short, obtuse, with broad snout, not distinct from neck, which is not dilatable; tail short. The shields of the head normal, but the loreal is absent. Nostril wide, lateral, between two shields; eye small, with round pupil; one præ-, two post-oculars; temporals in a single longitudinal series. Six, seven, or eight upper labials, the third and fourth entering the orbit. Scales smooth, not much imbricate, in thirteen rows, those of the vertebral series not enlarged. Subcaudals bifid. Maxillary with a grooved fang in front, without other teeth behind. The *Callophides* are more numerous on the East Indian continent than in the Archipelago; they are the representatives of the American *Elaps*, of the Australian *Vermicella*, and of the African *Homorelaps*. Cantor says they are generally seen lying motionless, with the body thrown into many irregular folds but not coiled.

Maticora lineata, Gray, *Illustr. Ind. Zool.*

Elaps intestinalis, Cantor, *Mal. Rept.* p. 107.

Günth. Colubr. Snakes, p. 230.

A variety from the Peninsula, Pinang, Singapore, and Central India (Malwah). Specimens from Java have the vertebral line continued in the head, where it is forked; it has no black edges; and the ground-colour is brown. This species occurs also in Sumatra, Borneo, and in the Philippine Islands; it attains to a length of 2 feet, the tail measuring 1½ inches.

Callophis gracilis, Gray. *Jnd. Zool.*

Elaps nigromaculatus, Cantor, *Mal. Rept.* p. 108.

A series of large, round, black, white-edged spots along each side of the back. Belly pale yellow with black cross bands, both colours being nearly equally divided. This fine species has been found only at Pinang and Singapore; it attains to a length of 28 inches, the tail measuring 1½ inches.

Callophis maclellandii, Günth. *Pr. Z.S.* 1861.

Elaps maclellandii, Reinh. *Calc. Journ. Nat.*

E. univirgatus, *Günth. Colubr. Snakes*, p. 231.

Callophis univirgata, *Günth. Proc. Zool. Soc.* 1859, p. 83.

Head and neck black above, with a yellow cross band behind the eyes. From Nepal and Darjeeling, a variety from Assam.

Callophis annularis, *Günth.* Body and tail reddish brown, without longitudinal band, but with forty narrow, equidistant, black white edged rings; belly yellowish, with a black cross band in the middle between the rings.

Callophis trimaculatus, *Günth. Proc. Zool. Soc.* 1859, p. 83. *Russell Ind. Serp.* i.

Vipera trimaculata, *Daud. Rept.* vi. p. 25.

Elaps trimaculatus, *Merr. Tent.* p. 143.

Coluber melanurus, *Shaw, Zool.* iii. p. 552.

Light bay above. Belly uniform white (red) during life. The coast of Tenasserim, Bengal, 12 inches long, the tail measuring $\frac{1}{2}$ inches. In addition to the above enumerates *Elaps malabaricus*, Jerdon, besides an *Elaps melanurus*, Shaw, the "*E. malabaricus*" appears to be the true *E. melanurus*, Shaw.

Callophis maculiceps, *Günth. Proc. Zool. Soc.* 1859, p. 84.

Elaps melanurus, *Cantor, Mal. Rept.* p. 106.

E. maculiceps, *Günth. Colubr. Snakes*, p. 232.

Light bay above, with a series of distant black dots along each side of the back; belly uniform whitish (red during life.) Found in the Malayan Peninsula; according to Cantor it exceeds a length of 2 feet.

Callophis nigrescens, *Günth. Ann. & Mag. Nat. Hist.* 1862, ix. p. 131.

C. concinnus, *Beddome, Madr. Quart. Journ. Med. Sc.* vi.

Upper parts dark blackish ash, or black, the lower uniform red. Nilgherries; the largest is 4 feet long, the tail measuring 5 inches.

Family of Sea Snakes—*Hydrophidæ*.

Body subcylindrical anteriorly, more or less compressed posteriorly; tail strongly compressed, elevated, paddle-shaped. Head-shields generally abnormal; loreal none. Nostrils situated on the upper side of the head, except in *Platurus*. Eye small, with round pupil. The venom-fang small, grooved in front, and with a canal in its interior terminating in a short slit. The Sea-snakes are inhabitants of the tropical parts of the Indian and Pacific Oceans, extending from the coast of Madagascar to the Isthmus of Panama; they are most numerous in the East Indian Archipelago and in the seas between Southern China and North Australia, being represented on the outskirts of the geographical range we have mentioned by only one species, and that the most common, viz. *Pelamis bicolor*. The most striking feature in the organization of the Sea-snakes is their

elevated and compressed tail, the processes of the caudal vertebrae being much prolonged and styliform. The food of the Sea-snakes consists entirely of small fish; all the species are viviparous, bringing forth, without leaving the sea, from four to nine young ones. They have very formidable and very numerous enemies in the sea-eagles (*Haliæetus*), in the sharks, and other large raptorial fishes. There is no other group of reptiles, the species of which are so little known, and the synonymy of which is so confused, as that of the Sea-serpents. Our present knowledge of the geographical distribution of most of the species is extremely vague.

Platurus, *Latr.* Body subcylindrical, of moderate length. Shields of the head subnormal in number and arrangement; nostrils lateral, in a single nasal shield, both nasals being separated from each other by a pair of anterior frontals. Scales imbricate, smooth; ventral shields well developed; tail with two series of subcaudals. The poison-fang is short, and not followed by a series of other simple teeth as in *Hydrophis*.

Platurus scutatus.

Coluber laticaudatus, *L. Mus. Ad. Fried.* 1754.

Laticauda scutata, *Laur. Syn. Rept.* p. 109.

Cantor, Mal. Rept. p. 125.

Hydrus colubrinus, *Schneid. Hist. Amph.* p. 233.

Platurus fasciatus, *Latr. Rept.* iv. p. 185.

Hydrophis colubrinus, *Schleg. Phys. Serp.* ii. p. 514. *Faun. Japon. Rept.* p. 92.

It is a common species, extending from the Bay of Bengal to the Chinese seas and to the coasts of New Zealand. The largest example seen is exactly 5 feet long.

Platurus fischeri, *Jan, Iconogr. descript. in Rev. et Mag. Zool.* 1859. Upper part of the snout yellow, upper labials black. They are from the Bay of Bengal, from Chartaboun on the coast of Siam, from New Guinea, and from Aneiteum (New Hebrides). The largest specimen is only 30 inches long.

Aipysurus, *Lacép.* Body not much compressed, with trenchant belly, of moderate length. Shields of the head generally divided into more or less numerous smaller pieces; normally only one pair of frontals; nostrils superior, each in a single nasal, the nasals being contiguous to each other. Scales of moderate size, imbricate, smooth or slightly tubercular. ventral shields well developed, with a longitudinal median ridge. Subcaudals broad, entire. The species of this genus appear to belong rather to the fauna of Polynesia and Australia than to that of British India.

Aipysurus anguillæformis.

Thalassophis anguillæformis, *Schmidt, Abhandl. Naturw., Hamb.* ii. p. 76.

A. margaritophorus, Bleek. *Natur. Tydschr.*
Nederl. Ind., xvi. p. 49.

Specimens have been captured on the coast of Java; the largest is more than 2 feet long.

Aipysurus lævis, Lacép. *Ann. Mus.* iv. pp. 197, 210.

Hypotrophis jukesii, Gray, in *Jukes, Voy. Fly* p. 333.
Stephanohydra fusca, Gray, *Viper. Snakes*, p. 50.
Aipysurus fuliginosus, Dum. & Bibr. v. p. 1327.
Fischer Abhandl. Naturw. Hamb. iii. p. 33.

When old, are uniform brown. From Darnley Islands, New Caledonia, and New Guinea. The largest measures more than 5 feet.

Aipysurus fuscus, Fischer, *Abhandl. Naturw. Hamb.* iii. p. 33.

Stephanohydra fusca, Tschudi, in *Wieg. Arch.* 1837, p. 331.

Either uniform brown, or each scale and ventral shield with a large brownish-black spot near the hind margin. Australian seas; 39 inches long.

Disteira, Lacép. Body compressed, of moderate length; head shielded above: a pair of anterior frontals between the nasals, which are small. Scales imbricate; ventral shields distinct, but small.

Disteira doliata, Lacép. *Ann. Mus.* iv. p. 199.
D. & B. Erpét. gén. vii. p. 1331, (not synon).
D. dumerillii, Jan. *Icon. descript. in Rev. et Mag. Zool.* 1859.

Back with broad brownish cross bands.

Acalyptus, Dum. & Bibr. Posterior half of the trunk compressed, of moderate length. Head covered with scales above, the snout and superciliary region only being shielded. Scales imbricate; ventral shields none.

Acalyptus superciliosus D. & B. vii. p. 1340. One of the scarcest Ophidians, only two specimens being known to exist in collections; the larger, 26 inches long, is in the British Museum. It is believed to inhabit some part of the south-western Pacific.

Hydrophis, sp., Daud. Posterior part of the body strongly compressed. Head short or of moderate length, shielded above; only one pair of frontals; nostrils superior, in a single nasal shield, both nasals being contiguous to each other. Scales imbricate or not imbricate, not polished, generally with a tubercle or with a keel. Ventral shields very narrow, or quite rudimentary, or entirely absent. Lower jaw without notch in front.

Hydrophis Jerdonii.

Hydrus nigrocinctus, var., Cant. *Mal. Rept.* p. 129.
Kerilia jerdonii, Gray, *Viper. Snakes*, p. 57.

Coasts of Madras and Pinang.

H. annulatus, Gray, *Viper. Snakes*, p. 59.

Astrotia schizopholis, Fischer, *Abhandl. Naturw. Hamb.* iii. p. 38.

Young specimens and adult males with broad black cross bands, which either extend only over the back or entirely surround the body. Old females nearly entirely uniform greyish above and whitish below, not rare on the northern coasts of Australia, but its occurrence in the Chinese seas and in the East Indian Archipelago (Singapore) is rather doubtful.

Hydrophis major.

Hydrus major, Shaw, *Zool.* iii. p. 558.

Pelamis shavii, Merr. *Tent.* p. 139.

Hydrophis mentalis, Gray, *Zool. Misc.* p. 62.

Back of the trunk with thirty-one large rhombic black spots, rather broader than the interspaces between them, and not extending downwards to the middle of the sides. Said to be from the Indian Ocean. 4½ in. long, cleft of mouth 10 lines, tail 4½ inches.

Hydrophis robusta.

Hydrophis nigrocineta, Sch. *Ph. Serp.* ii. p. 505.
Fischer, Abhandl. Naturw. Hamb. iii. p. 46.

This snake, is 6 feet long; found on the coasts of India and Archipelago.

Hydrophis Belcheri.

Aturia belcheri, Gray, *Viper. Snakes*, p. 46.

Back brownish olive, with blackish cross bands anteriorly. Sides and belly yellowish. New Guinea, 34 inches long, the cleft of the mouth measuring ½ inch, the tail 3½ inches.

Hydrophis cærulescens Gr. *Zo. Misc.* p. 62.

Hydrus cærulescens, Shaw, *Zool.* iii. p. 561.

H. hybrida, Schly. *Abbild.* p. 116. *Fischer Abhandl. Naturw. Hamb.* iii. p. 74.

Yellowish. Bay of Bengal Pinang; Java. The largest is 2 feet long.

Hydrophis aspera, Gray, *Viper. Sn.* p. 55.

Dirty yellowish: Upper side of the head uniform blackish in the adult. Said to be from Singapore, 43 inches long, tail thick 4½ inches.

Hydrophis spiralis, Gray, *Vip. Sn.* p. 54.

? Shiddi, Russell, Ind. Serp. ii.

Hydrophis schlegelii, *Fischer, Abhandl. Naturw. Hamb.* iii. p. 50.

H. laevis, *Lutken, Naturw. Foren, Vidensk. Meddel.* 1862,

Head uniform blackish olive above, with a whitish supraciliary edge. Tail black, with narrow whitish cross bars. The Indian Ocean; largest is 30 inches long, the cleft of the mouth $\frac{3}{8}$ inch, the tail 3 inches.

Hydrophis ellioti.

Aturia ornata, var. 2, *Gray, Viper. Snakes*, p. 45.

Head uniform greenish olive in the adult, reticulated with yellow above in the young. All the lower parts and, in the adult, the sides whitish. One male is 49 inches long, tail 5 inches; another adult, from Siam, is 29 inches long, the tail $2\frac{1}{2}$ inches, cleft of the mouth $\frac{3}{8}$ inch.

inch. The others are young, from Madras and Ceylon.

Hydrophis pachycercus. *Fischer, Abhandl. Geb. Naturwiss. Hamb.* iii. p. 44. Body brownish yellow above. From the East Indian Archipelago; it is 36 inches long, the tail measuring 9 inches.

Hydrophis viperina.
Thalassophis viperina, *Sch., Abh. Nat. Hamb.* ii. p. 79.
Disteira praescutata, *D. & B. Erp. gen.* vii. p. 1351.
Hydrophis doliata, *Fisch., Abh. Nat. Hamb.* iii. p. 56.
Back with from thirty-one to thirty-eight rhombic black spots, from the coast of Madras.

Hydrophis ocellata, *Gray, Viper. Snakes*, p. 53. Back with from thirty-two to thirty-four blackish cross bands, head uniform brownish olive; from the Australian seas only. 44 inches long, cleft of mouth $\frac{7}{8}$ inch tail, 5 inches.

Hydrophis anomala. *Fischer, ibid.* p. 58.
Thalassophis anomala, *Schmidt, Abhandl. Naturw. Hamb.* ii. p. 81.
Samarang, 32 inches long.

Hydrophis curta.
Hydrus curtus, *Shaw, Zool.* iii. p. 562.
Lapemis curtus, *Gray, Zool. Misc.* p. 60.
Hydrophis propinquus, *Jan. Iconogr. descr. in Rev. et Mag. Zool.* 1859.

Tail black, with only two yellow transverse spots at its root. The largest is only 17 inches long, the cleft of the mouth being $\frac{5}{8}$ inch, the tail $1\frac{3}{4}$ inch. Madras is the only well-authenticated locality where it has been found.

Hydrophis hardwickii.
Lapemis hardwickii, *Gr. Z. M.* p. 60, *Ind. Zool.*
? *Hydrophis pelamidoides*, *Schl. Ph. Serp.* ii. 512.
Schl. Faun. Japon. Rept. pl. 9. *Fischer, Abhandl. Naturw. Hamb.* 1856, iii. p. 64.

Tail black, with from three to five yellowish bands across its basal half. Procured at Pinang; it is 20 to 30 inches long, cleft of the mouth $\frac{3}{4}$ inch, tail $2\frac{1}{2}$ inches.

Hydrophis loreata.
H. pelamidoides var. *annulata*, *Fisch. Abhandl. Naturw. Hamb.* 1856.
Lapemis loreatus, *Gr. A. & M. N. Hist.* 1843.
L. hardwickii, var. *Gray, Vip. Sn.* p. 44.
Borneo; Philippines; 3 ft. long, tail $3\frac{3}{4}$ in. cleft of mouth, 1 inch.

Enhydrina, *Gray*. Differing from *Hydrophis* only by having a deep longitudinal notch, in front of the lower jaw.

Enhydrina bengalensis, et *E. valakadyen*, *Gray, Viper. nakes*, p. 48.
Valakadyen, *Russell, Ind. Serp.* i.
Hydrus valakadyen, *Boie, Isis*, 1827, p. 554.
Hydrophis schistosa (not *Daud.*), *Schleg. Phys. Serp.* ii. p. 509. *Fischer, Abhandl. Naturw. Hamb.* iii. p. 48. *Dum. & Bibr. Erpét. gen.* vii. p. 1344.
Hydrus schistosus, *Cantor, Mal. Rept.* p. 132.
Hydrophis bengalensis et *H. subfasciata*, *Gray, Zool. Misc.* p. 92.

Thalassophis werneri, *Schmidt, Abhandl. Naturw. Hamb.* ii. p. 84.

Common in the Bay of Bengal and in the western parts of the Archipelago, extending to the coast of New Guinea; it attains rarely to a length of 4 feet, a newborn individual measuring 10 $\frac{1}{4}$ inches.

Pelamis, sp. *Daud.* Head flat, with very long, spatulate snout; neck rather stout; body of moderate length. Nasal shields contiguous, longer than broad, pierced by the nostril posteriorly; only one pair of frontals. Scales not imbricate, not polished, tubercular or concave. Ventral shields none or very narrow. Lower jaw without notch in front.

Pelamis bicolor. *Russell, i.* p. 47. *Daud. Rept.* vii. p. 366, *Gray, Viper. Snakes*, p. 41. *Fischer, Abhandl. Naturw. Hamb.* 1866, p. 61.
Hydrus bicolor, *Schneid. Hist. Amph.* p. 249 *Cantor, Mal. Rept.* p. 135.
Hydrophis variegata, *Schleg. Faun. Japon.*
H. pelamis, *Schleg. Phys. Serp.* ii. p. 508.
Pelamis ornata, *Gray, Viper. Snakes*, p. 43.

One of the most common sea-snakes, and has the widest geographical range of all the species of this family; it appears to be found throughout the tropical and subtropical parts of the Indian and Pacific Oceans. Up to 3 ft.

THIRD SUB ORDER.

Ophidii viperiformes—Viperine snakes.

Snakes with a long, perforated, erectile fang on the maxillary, which is extremely short, without any other teeth.

Family of Pit-Vipers—*Crotalidæ*.

Body robust; tail of moderate length or rather short, sometimes prehensile; head broad, subtriangular, frequently scaly above or imperfectly shielded; a deep pit on the side of the snout, between the eye and nostril; eye of moderate size, with vertical pupil. Viviparous. The Pit-Vipers are found only in Asia and America; those of the New World surpassing the Asiatic species in size, and therefore they are much more dangerous.

Trimeresurus, sp., *Lacép. Ann. Mus.* 1804, iv. p. 196. Head triangular, covered above with small scales, except the foremost part of the snout and the supraciliary region, which generally are shielded; body with more or less distinctly keeled scales, in from seventeen to twenty-seven series. Body and tail of moderate length, prehensile. Subcaudals two-rowed. The Trimeresures are Tree-snakes, as is indicated by their prehensile tail and by their green or varied coloration. In general they are sluggish, not attempting to move out of the way, and as they very closely resemble the branch on which they rest, they are frequently not perceived until they prepare to dart, vibrating the tail and uttering a faint hissing

sound, or until they have bitten the disturber of their rest. The bite of larger specimens, from 2 to 3 feet long, is more dangerous, and has occasionally proved fatal. When roused these snakes are extremely fierce, striking at everything within their reach, and Cantor says that in the extreme of fury they will fix the fangs in their own bodies. Frogs, mammals, and birds form their food. The *Trimeresures* occur only in the East Indies, and belong to a tribe of snakes which is provided with a singular pit in the loreal region, and found in the New and Old World. The use of this organ is not known.

Trimeresurus gramineus, Russell, *Ind Serp.* i. Coluber gramineus, Shaw, *Zool.* iii. p. 420. *Vipera viridis*, Daud. *Rept.* vi. p. 112. *V. gramineus* Cantor, *Mal. Rept.* p. 119. *Trim. viridis*, Gr. A. & M. N. H. 1842, xii. p. 391. *T. elegans*, Gr. A. & M. Nat. Hist. 1853, xii. p. 391. Grass-green, above, lighter on the sides; tail sometimes cinnamon-red. From Pinang, Mergui, the Lao Mountains in Cochin-China, Khasya, Sikkim, Ladak, and Ningpo in China. Length up to 32 inches, but is generally smaller.

Trimeresurus erythrurus, Russell, *Ind. Serp.* ii. *Trigonocephalus erythrurus*, C. P. Z. S. 1839, p. 31. *Trimeresurus albolabris*, Gray, *Zool. Misc.* p. 48. *Trigonoceph. viridis*, Schl. *Phys. Serp.* ii. p. 544. Delta of the Ganges, Java, Siam, China. An old female measures 33 inches, the tail being 6 inches.

Trimeresurus carinatus, Gray, *Z. Misc.* p. 48. *T. bicolor*, Gr. A. & M. N. Hist. 1842, xii. p. 392. *T. porphyraceus*, Blyth, J. A. S. B 1361, xxix. 110. *Cryptelytrops carinatus*, Cope, *Proc. Acad. Nat. Sc. Philad.* 1859, p. 340.

From Sikkim and Rangoon. An adult female is 37 inches long, the tail measuring 6 inches.

Trimeresurus purpureus, Gr. *Z. Misc.* p. 48. *Trigonocephalus purpureo-maculatus*, Gr. *Ind. Z.* *T. puniceus*, Cantor, *Mal. Rept.* p. 122.

Dull reddish brown. hitherto found only at Pinang and Singapore. 38 inches long, tail measuring 6 inches.

Trimeresurus anamallensis. Anamallay Mountains largest is 24 inches long, the tail 3½ inches.

Trimeresurus monticola. *Paras maculata*, Gray, *Ann. and Mag. Nat. Hist.* 1853, xii. p. 392 (not *Trimeresurus maculatus*.)

Nepal, Sikkim; an adult female is 21 inches long, the tail measuring 2½ inches.

Trimeresurus wagleri. *Trigonocephalus wagleri*, S. Ph. *Serp.* ii. p. 542. *Trimeresurus maculatus*, Gray, *Zool. Misc.* p. 48, and *Viper. Snakes*, p. 8.—[This *Tr. maculatus*, is composed of young specimens of *Tr. wagleri*, Schlæg. and of *Tr. formosus*, Gray; Gunther considers the latter as a Bornean variety of *Tr. wagleri*, and different from the *Tr. formosus* of Muller and Schlæg.]

Trigonocephalus sumatranus, Cantor, *Mal. Rept.*

p. 121, not *Coluber sumatranus*. Raffles, a snake said to have 184 ventral shields.)

Trimeresurus sumatranus, Gray, *Viper. Sn.* 10. *T. subannulatus*, Gray, *Viper. Snakes*, p. 9. Motley & Dillwyn, *Nat. Hist. Labuan*, p. 44. *T. formosus*, Gray, *Viper. Snakes*, p. 10. (not Mull. & Schlæg.)

Young: Grass-green above; half-grown specimens a yellowish-green centre, Old specimens 3 feet long, are black; is common in the Malayan peninsula; other varieties occur in almost all the larger islands of the Archipelago. Three feet, feeds on small mammals, birds, and frogs.

Trimeresurus strigatus, Gray, *Zool. Misc.* p. 48.

Trigonocephalus neelgherriensis, Jerdon, *Journ. As. Soc. Beng.* 1854, xxii. p. 524. Nilgherries Dekkan. Largest 19 inches long, tail 2½ inches.

Trimeresurus trigonocephalus. *Cophias trigonocephalus*, Merr. *Tent.* p. 156. *C. nigro-marginatus*, Kuhl, *Reitr.* p. 20. *Trigonocephalus nigromarginatus*, Schlæg. *Phys. Serp.* ii. p. 541.

Megaera trigonocephala, Wagl. *Syst. Amph.* p. 174. Gray, *Zool. Misc.* p. 49. *M. olivacea*, Gray, *Zool. Misc.* p. 49.

Green, with a network of black stripes on the head. Peculiar to Ceylon, and not very common; it is a Tree-snake with a strongly prehensile tail, length 31 inches, tail 5 inches.

Trimeresurus mucrosquamatus. *Trigonocephalus mucrosquamatus*, Cantor, *Proc. Zool. Soc.* 1839, p. 32.

Brownish grey above, with black, white-edged rings.

Pelteopelorus Gthr. A large pit in the loreal region. Head covered with large, shield-like, imbricate scales; body with twelve series of very large keeled scales. Body and tail of moderate length, prehensile. Subcaudals two-rowed. Only one species is known.

Pelteopelorus macrolepis. *Trimeresurus macrolepis*, Beddome, *Madras Quart. Journ. Medic. Sc.* vol. v.

Anamallay Mountains; the largest specimen is 21 inches long, the tail measuring 4½ inches. It is a Tree-snake, closely allied to *Trimeresurus*.

Calloselasma, Cope, *Pr. Ac. N. Sc. Phil.* 1859, p. 336. Head triangular, pointed in front, covered with the normal number of shields above. Body of moderate length, with smooth scales, in twenty-one series. Tail of moderate length, not prehensile, terminating in a long spinelike scale. Subcaudals two-rowed. Only one species is known.

Calloselasma rhodostoma, Russ. *Ind. Serp.* ii. *Trigonocephalus rhodostoma*, Reinw. *Isis.* 1827, p. 561. Schl. *Ph. Serp.* ii. p. 547 & *Abbild.* p. 59.

Java, Siam; is one of the most beautiful and most dangerous venomous snakes. Feeding on frogs, it frequents grassy plains, and approaches gardens and human dwellings. Kuhl saw two men bitten by one and the same snake who expired five minutes after. Length 3 feet.

Halys, Gray. Head broad, obtuse in front, covered with the normal number of shields above. Body of moderate length, with keeled scales, in from twenty-three to twenty-seven series. Tail rather short, not prehensile, terminating in a long spine-like scale. Subcaudals two-rowed. Central Asia, Tartary, on the northern side of the Himalayas, in China, Japan, and Formosa.

Halys elliotti.

Trigonocephalus elliotti, Jerdon. Journ. As. Soc. Beng. xlii. 1854, p. 523.—Form massive; up to 2 feet and upwards long.

Halys blomhoffii.

Trigonocephalus blomhoffii, Boie, Isis. 1826, p. 214. Schleg. Phys. Serp. ii. p. 552. and Faun. Japan. Rept. Gray. Viper. Snakes, p. 14.

T. affinis Gray, Viper. Snakes, p. 14.

Japan, Formosa and probably in China.

Halys himalayanus.

Trigonocephalus affinis, Gunth, Proc. Zool. Soc. 1860, p. 167 (not Gray).

Body of moderate length, rounded; dark brown, belly almost entirely black, marbled with yellowish. From Garhwal, Himalayas (altitude 9000 feet). The longer of the two specimens is 25 inches, tail $3\frac{1}{4}$ inches.

Hypnale, Fitz. Head broad, triangular; snout covered with numerous small shields above, the crown of the head being normally shielded. Body of moderate length, with keeled scales in seventeen rows. Tail rather short, not prehensile, terminating in a short conical scale. Subcaudals two-rowed. Only one species is known.

Hypnale nepa.

Coluber nepa, Laur. Syn. p. 97. Russell, Ind. Serp. ii.

Carawala, Davy, Ceylon, p. 85.

Cophias hypnale, Merr. Tent. p. 155.

Trigonocephalus hypnale, Wagl. Syst. Amph. p. 174. Schl. Ph. Serp. ii. p. 550. Gr. Vip. Sn. p. 15.

Trimerurus, ? ceylonensis, Gray, Zool. Misc. p. 48, and Vip. Snakes, p. 11.

Trigonocephalus zara, Gray, Viper. Snakes, p. 15.

Brown or grey or reddish olive, with a double dorsal series of brown or black spots; the spots of both sides sometimes confluent into cross bands. Found in Ceylon, but also in the peninsula of Southern India, the Anamallay Mountains. The Carawala is much dreaded, although its bite is but exceptionally fatal to man, and in such cases death does not occur before the lapse of some days.

Family of Vipers.—*Viperidae.*

Body robust; tail rather short, not prehensile; head broad or thick, generally scaly above, or incompletely shielded; no pit in the loreal region; eye of moderate size, with vertical pupil. Viviparous. The Vipers inhabit the Old World and Australia, and are thoroughly terrestrial snakes. Africa produces the largest species and the greatest variety of forms. Only two are known from British India:—

Daboia, Gray. Head covered with scales; nostril lateral, oblique, extremely large, in and between three nasal shields; a narrow supraciliary shield. Sides of the head covered with keeled scales, several series of which are between the orbit and the low upper labials. Scales much imbricate, strongly keeled, in twenty-nine or thirty-one series. Subcaudals two-rowed. Only one species is known.

Daboia russellii.

Tio-polonga, Russell, Ind. Serp. i. p. 10; ii. p. 37. Davy, Ceylon, p. 85.

Coluber russellii, Shaw, Zool. iii. p. 418.

Vipera elegans, Duud. Rep. vi. 124. Schl. Ph. Serp. ii. 588.

V. daboia, Davd. Rept. vi. p. 119.

Daboia elegans, G.Z.M. 69, Viper. Snakes, p. 23.

D. pulchella, Gray, Zool. Misc. p. 69.

D. russellii, Gray, Viper. Snakes, p. 24.

Cobra monil of Europeans in Peninsula.

Tio-polonga of Ceylon.

Grevish brown. Belly uniform yellowish or marbled with brownish. A native of Ceylon and of the peninsula of India: the Anamallay Mountains, Waltair, Bombay, and Almorah, (5,500 feet elevation) the Himalayas, in Kuluat 3,400 feet. Length 50 inches, tail measuring 7 inches; it is thoroughly terrestrial, feeding chiefly on mice. It is one of the most common venomous snakes, and, on account of its size and nocturnal habits, more dangerous than the *Trimeresurus* and *Hypnales*.

Echis, sp., Merr. Head covered with keeled scales; a pair of very small frontals behind the rostral shield. Nostril small, round, directed upwards, situated in a large nasal shield, which is subdivided behind the nostril. Sides of the head covered with keeled scales, two series of which are between the eye and the low upper labials. Scales much imbricate, strongly keeled, in from twenty five to twenty-nine series, those in the lateral series have their tips directed obliquely downwards. Subcaudals one-rowed.

Echis carinata, Merr. Tent. p. 149.

Pseudoboa carinata, Schn. Hist. Amph. ii. 285.

Horatta Pam, Russell, Ind. Serp. i.

Brown or brownish grey. Belly whitish. This little venomous snake is common in the Anamallay, the Carnatic, and vicinity of Madras; largest 20 inches long, tail measuring $2\frac{1}{2}$ inches.

Second Sub-Class. *Batrachians*.

Only one ventricle of the heart ; atrium incompletely divided into two. Passing through a metamorphosis. Breathing by gills in an early stage of their development, the gills being permanent in some species. Two occipital condyles.

The Order of Tailless Batrachians.—*Batrachia Salientia*.

Body broad, short, in the perfectly developed state with four legs and without tail. The Batrachians are distinguished from the other divisions of the vertebrate animals by their passing through a *metamorphosis*—that is, after their embryonal life, undergoing changes which affect not only their external form, but also their internal organs. Moisture is as necessary for Batrachians as food and air, hence they are found only in damp places or in the neighbourhood of water ; and when the hot season commences. When they dive the lungs are emptied, and the respiration remains interrupted for one or two hours, after which time the animal is compelled to rise to the surface in order to breathe. Many Batrachians live at some distance from water ; all, however, as far as is known at present, enter it at the season of propagation. The males have also generally a distinctly more slender form than the females. the eggs are impregnated the moment they are deposited by the female in the water ; The young ones, or tadpoles, have a thick ovate body without legs, terminating in a long, strong, compressed tail, which serves as an organ of locomotion in the water. The development is about a hundred days in the European *Rana temporaria*. But several years elapse before the young perfect batrachian attains its full size. None are poisonous.

Bombinator sikkimensis, *Blyth*, *J. A. S. B.* 1854, xxiii. 300. Colour dull livid olive green above, flame coloured below marbled with dusky.

Oxyglossus, *Tschudi*. Fingers quite free ; toes webbed to their tips by a very extensible membrane. Skin glandular or nearly smooth. Vomerine teeth none ; tongue more or less elongate, not notched behind. Openings of the eustachian tubes small. Vocal sac single, internal. Only two species are known, one, *O. lavis*, being confined to the Philippine Islands, whilst the other is found in the Archipelago as well as on the Continent.

Oxyglossus lima, *Tschudi*, *Batr.* p. 85. *Dum & Bibr.* viii. p. 334.

1½ inch long ; hind limb not quite 2 inches in length. Sea-coasts of Siam and Gamboja, China and Java ; it is said to occur also in Bengal.

Dicroglossus, *Glar.* Fingers free ; toes broadly webbed ; tongue rather elongate, deeply notched behind ; vomerine teeth none ; openings of the eustachian tubes of moderate width, tympanum indistinct ; vocal sacs of the male external and lateral. Only one species is known.

Dicroglossus adolfi, *Gunth Pr. Z. S.* 1860, 158. Length of the head and body 1 inch 7 lines ; of the fore leg 10 lines ; of the hind leg 2 inches 4 lines. Kulu and Simla, at 2,400 to 4,200 feet above the sea.

Rana, *auct.* Fingers quite free, none of them opposed to the others ; toes webbed ; head covered with skin. Vomerine teeth in two series or groups ; tongue large, oblong, free and deeply notched behind. Metatarsus with one or two blunt tubercles. True frogs are found in almost every part of the globe, except in Australia and in the islands of the Pacific. Jerdon mentions *R. crassa* ; *R. flavescens* ; *R. agricola*, *R. niligrica* from Peninsula. Blyth mentions *R. fusca* & *R. altelabris* from Pegu. *R. trivittata* ; *R. nebulosa* & *R. multistriata* of Hong-Kong. *R. Neweraelia* is of Ceylon.

Rana kuhlii *Schleg. D. & B. Erpet. gen.* p. 384. *Gunth. Batrach. Sal.* p. 8.

R. corrugata, *Peters, Mona. Berl. A. c.* 1863, p. 412. Not uncommon in Ceylon and found in Java, Celebes, and at Ningpo in China.

Rana hexadactyla, *Lesson, in Belang. Voy. Ind. Orient. Rept.* p. 331.

Dactylethra bengalensis, *Less. Ill. Zool.* p. 47. *Rana outipora*, *D. & B. Erp. gen.* viii. p. 339. *R. robusta*, *Blyth, J. A. S. B.* 1854, xxiii. 298. Ceylon, Madras.

Rana cyanophlyctis, *Schneid. Hist. Amph. i.* p. 137. *Peters, Sitzgsber. Berl. Acad.* 1863, p. 78.

R. bengalensis, *Gr. Ind. Zool. Kelaart, Prodr. Faun. Zeyl. i.* p. 192.

R. leschenaultii, *D. & B. Erp. gen.* viii. 342. *Cant. Mal. Rep.* p. 138.

Common in Ceylon and Southern India, less numerous in the Malay peninsula ; it occurs also in Lower Bengal.

Rana tigrina, *Daud. Rein. p.* 64. *Dum. & Bibr. Erpet. gen.* viii. p. 375. *Kelaart, Prodr. Faun. Zeyl. i.* p. 192. *Gunth. Batrach. Sal. p.* 9. *Peters, Sitzgsber. Berl. Acad.* 1863, p. 77. *R. cancrivora* (*Boie*), *Gravenh. Delic.* p. 41. *R. brama*, *Less., in Belang. Voy. Ind. Orient. Rept.* p. 329.

R. vittigera, *Wieg. Nov. Act. Acad. Leopold. Carol.* 1835, xvii. p. 255.

R. rugulosa, *Wieg. l. c. p.* 258.

The upper parts are brown, lower parts whitish. It is the "Bull-frog" of Europeans, is very common over almost the whole of India, Ceylon, Southern India,

Sikkim, Bengal, Malay Peninsula, China, and islands of the Archipelago.

Rana liebighii, *Gunth. Pr. Z. S.* 1860 p. 157. Sikkim. Nepal.

Rana esculenta, *L. Syst. Nat.* i. p. 357. *Schleg. Faun. Japon. Rept.* p. 109.

R. cacinannas, (*Pallas*) *Eichwald, Faun. Casp. Caucas.* p. 126.

R. marmorata, *Hallowell. Proc. Acad. Nat. Sc. Philad.* 1860, p. 500.

1. *Rana nigromaculata*, *Hallowell, l. c.*

Usual length 3 inches, the hind limb 5 inches. It is found in every part of Europe, in North Africa, through Central Asia, to China, Japan, Ningpo and Chusan.

Rana silvatica, *Leconte. Ann. Lyc. Nat. Hist. New York*, i. p. 282.

Rana temporaria, *Schleg. Faun. Japon. Rept.* p. 109, pl. 3, fig. 2.

R. temporaria, var. *japonica*, *Gunth. Batrach. Sal.* p. 17.

Brownish or brownish olive; Japan, neighbourhood of Ningpo. It is closely allied to *Rana temporaria*.

Rana gracilis, *Wieg. Nov. Act. Acad. Leopold. Carol.* 1835, xvii. p. 257. *Peters, Monatsber. Berl. Acad.* 1863, v. 78.

R. vittigera, *Gunth. Batrach. Sal.* p. 9 (not *Wieg.*)

Greyish olive, with large dark spots and bars on the back and limbs; uniform white below. Only $1\frac{1}{2}$ inch long, the hind limb $2\frac{1}{3}$ inches common near Ningpo and Hongkong, found in Loochoo, the Himalaya (Jámu), Siam, and Madras.

Hoplobatrachus, *Peters, Monatsber. Berl. Acad.* 1863, p. 449. Fingers quite free; toes completely webbed. Vomerine teeth in two oblique series; tongue deeply notched behind. Openings of the eustachian tubes small. Metatarsus with a flat, sharp-edged prominence.

Hoplobatrachus ceylonicus, *Peters, l. c.* Dark green above, with blackish markings: Trincomallee. Length of body $3\frac{1}{2}$ inches, of the hind limb $5\frac{1}{2}$ inches.

Pyxicephalus, sp., *Tschudi.*

Tomopterna (*Bibr.*) et *Sphærotheca*, *Gunth. Batrach. Sal.* pp. 7 & 20.

Fingers quite free; toes incompletely webbed. Vomerine teeth in two oblique series; tongue large, free and deeply notched behind. Openings of the eustachian tubes small. Metatarsus with a flat, sharp-edged, shovel-like prominence.

Pyxicephalus breviceps.

Rana breviceps, *Schneid. Hist. Amph.* i. p. 142. *Peters, Monatsber. Berl. Acad.* 1863, p. 76.

Pyxicephalus todians, *Jerd. J. A.S.B.* 1854, 534.

P. pluvialis, *Jerdon, l. c.*

Sphærotheca strigata, *G. B. S.* 20, pl. 2, fig. A.

Tomopterna strigata, *Gunth. Pr. Z. S.* 1860, 165.

Above yellowish brown. The largest 2 inches or more in length; hind legs $2\frac{1}{2}$ or $2\frac{3}{4}$ inches, the males having the toes a little more slender than the females. Found in the Peninsula of India, Simla and Ceylon.

Pyxicephalus rufescens, *Jerdon. Journ. As. Soc. Beng.* 1854, p. 534. Of a rufous colour above, whitish beneath; body rough and granulose; limbs barred. Length $1\frac{1}{2}$ inch; hind leg $2\frac{1}{10}$ inches; foot $\frac{1}{2}$ inch. Not rare in gardens on the Malabar coast.

Megalophrys, *Kuhl.* Fingers quite free; toes with a short but distinct interdigital membrane. Head and body much depressed; eyelid prolonged into a triangular flap; cleft of the mouth large. Vomerine teeth present. Tongue circular. Tympanum hidden; openings of the eustachian tubes of moderate width. Male without vocal sac.

Megalophrys montana, (*Kuhl.*) *Wagl. Syst.* p. 204. *Dum. & Bibr.* viii. p. 458. *Gunth. Batrach. Sal.* p. 36. *Female.*

Ceratophrys montana, *Schl. Abbild.* p. 29. taf. 10, fig. 3. also p. 30.

Megalophrys montana, *Cant. Mal. Rept.* p. 140.

Ceratophryne nasuta, *Schleg. in litt. Gunth. Batrach. Sal.* pp. 37 & 136. *Schleg. Handb. Dierk.* ii. p. 57, pl. 4. fig. 72.

Pinang, Java Sumatra, Ceylon, Philippines.

Xenophrys, *Gthr.* Fingers and toes tapering, free to the base. Lower jaw without prominent apophyses; the internal openings of the nostrils and eustachian tubes small; tympanum rather small and inconspicuous. No parotoids. The transverse processes of the sacral vertebra much dilated. Vomer with two separate prominences, which are apparently toothless. The upper eyelid is well developed, broad, with a sharp, prominent edge, but without appendages. A single species from the Himalayas.

Xenophrys monticola. *Gunther.* Similar in habit to *Megalophrys montana*. Upper parts brownish olive. From Sikkim and from Khasya. 19 lines long, hind limb 31 lines.

Cacopus, *Gthr.*

Uperodon, *Dum. & Bibr.*

Head very short; mouth small; limbs short. A series of four papillæ across the palate: one on the hind margin of each choana, and two on a pair of osseous prominences of the vomer. Tongue circular, scarcely notched behind. Tympanum hidden; openings of the eustachian tubes of moderate width. Toes slightly webbed; metatarsus with a pair of large compressed prominences. Male with a vocal sac.

Cacopus systema. *Gunther.*

Rana systema, *Schneid. Hist. Amph.* i. p. 144. *Peters, Monatsber. Berl. Acad.* 1863, p. 82.

REPTILES

REPTILES

Engystoma marmoratum, *Ouv. Regne Anim.*
Uperodon marmoratum, *D. & B. viii. 749.*
Gunth. Bat. Sal. 49.
 Carnatic; length $2\frac{1}{2}$ inches, hind limb $2\frac{1}{2}$ inches.

Cacopus globulosus. *Gunther*, Russelcondah, in Madras Presidency; body surrounded by a mass of ovaries.

Diplopelma, *Gthr.* Head small, with rather pointed snout; mouth narrow; body thick; upper arm and thigh rather short. Teeth none, in jaws or on the palate. Tongue elongate, ovate, entire behind. Tympanum hiduen; openings of the eustachian tubes very small. Skin smooth; fingers free, toes one-third webbed; metatarsus with two obtuse tubercles. Male with a single subgular vocal sac.

Diplopelma ornatum, var. *A.*, *Günth. Batr. Sal. p. 50.*

Engystoma ornatum, *Dum. & Bibr. viii. p. 745.*
 One of the smallest Indian frogs, 1 inch long Madras Presidency, Southern India and Ceylon.

Diplopelma pulchrum. *Gunth.*
Diplop. ornatum, var. *B.*, *Günth. Batr. Sal. p. 50.*
Engystoma pulchrum, *Hal. P.A.N. 4. P. 1860, 506.*
 Yellowish or greyish-olive above; China, Ningpo, Hongkong, and Siam. Total length 13 lines, hind limb 24 lines.

Bufo, *auct.* Snout rounded or truncated; limbs rather short. Teeth none. Tongue elongate-ovate, entire and free behind. Parotoids very distinct, swollen; skin more or less warty. Openings of the eustachian tubes of moderate width. Fingers quite free; toes generally half-webbed, sometimes entirely webbed. Males generally with a single vocal sac, which is not visible externally.

Bufo vulgaris. The Common European Toad. *Saur. Syn. Rept. pp. 28, 125. Eichw. Faun. Casp. Cauc. p. 127. Dum. & Bibr. viii. p. 670. Günth. Batr. Sal. p. 55.*

Rana bofo, *L. Syst. Nat. i. p. 354. Roessel, p. 85.*
B. cinereus, *Schneid. Hist. Amph. p. 185.*
B. palmarum, *Ouv. Regne Anim. Asiatic varieties:—*
Bufo vulgaris japonicus, *Sc. Faun. Jap. Rept. 106.*
B. gargarizans, *Can. Ann. & Mus. N. H. 1842, ix. 483.*
B. griseus, *Hallow. Pr. Ac. N. Sc Philad. 1860, 506.*

This species extends from Western Europe, through the temperate parts of Central Asia, to Mauritius China, and Japan.

Bufo calamita. *Roessel, Hist. Ran. Laur. Syn. Rept. 27. Gun. Batr. Sal. 57. The Natter Jack.*

B. calamita, *Laur. Syn. Rept. 27. Gun. Batr. Sal. 57.*
 Found in many parts of Europe, also in Tibet. Rarely exceeds a length of $2\frac{1}{2}$ inches.

Bufo kelaartii, *Günth. Batr. Sal. p. 140.*
Adenomus badiolavus, *Cope. Proc. Acad. Nat. Sc. Philad. 1860, p. 371.*
 Peculiar to Southern Ceylon; 24 lines long.

Bufo galeatus. Gamboja; $2\frac{1}{2}$ inches long.

Bufo melanostictus. The Common Indian Toad. *Schneid. Hist. Amph. p. 216. Cantor, Mal. Rept. p. 142.*

B. scaber, *Daud. Rept. viii. p. 194. Schleg. Abild. p. 64. Dum. & Bibr. viii. p. 699.*

B. bengalensis, *Daud. l. c. p. 197.*

B. carinatus, *Gray, Ind. Zool.*

B. dubia, (*Shaw*), *Gray, Ind. Zool.*

Himalaya Sikkim Nepal, every part of the Indian continent from Southern India to China and the Philippine Islands; in the Himalaya it ascends to an altitude of 9,000 feet.

Bufo asper, *Schl. Abbild. 63. D. & B. viii. p. 668.* Java, Borneo, Celebes, Sumatra, Mergui; length $5\frac{1}{2}$ inches.

Hylorana, *Tschudi*. Skin smooth, generally a glandular fold along each side of the back. Vomerine teeth present. Tongue elongate and deeply notched behind. Tympanum distinct. Limbs generally slender; fingers quite free, toes broadly webbed; disks of the fingers and toes not much developed.

Hylorana macrodactyla, *Gunth. Bat. Sal. 72.*

Hongkong. Length of body $1\frac{1}{2}$ inch; length of cleft of mouth $\frac{1}{2}$ inch; length of front limb $\frac{2}{3}$ inch; length of hind limb 3 inches.

Hylorana erythræa. *Gunth.*

Hyla erythræa, *Schleg. Abbild. p. 24.*

Hylorana erythræa, *Tschudi. Batr. p. 78.*

Limnodytes erythræus, *D. & Bib. viii. 511. C. M. R. 141.*

Sumatra, Java, the Philippine Islands, Oceania (San Christoval, Solomon Islands); the Malay Peninsula and the south coast of Siam. Length 2 inches, 8 lines, hind limb 4 inches 7 lines, fourth toe 1 inch 5 lines.

Hylorana macularia. *Gunth.*

Limnodytes macularius, *Blyth, Journ. As. Soc. Beng. 1855, xxiii. p. 299.*

Ceylon: length $2\frac{1}{2}$ inches.

Hylorana malabarica. *Gunth.*

? *Rana sanguineo maculata*, *Less. in Belang. Voy. Ind. Orient. Zool. p. 328. Rept.*

Rana malabarica, *Dum. & Bibr. viii. p. 365.*

Malabar Coast; one specimen 2 inches 10 lines long.

Hylorana temporalis.

Hylorana malabarica, *Kelaart, Prodr. Faun. Zeyl. Rep. p. 191. Günth. Batrach. Sal. pp. 181 & 142. (not synonym.)*

Ceylon only. Length of body 3 inches.

Polypedates, *Dum & Bibr.* Skin smooth, rarely with tubercles; no glandular fold on the side of the back, a short fold from behind the eye above the tympanum. Vomerine teeth present (in adult specimens). Tongue elongate and deeply notched behind. Tympanum more or less distinct. Limbs of proportionate

length; fingers shortly webbed, or free; toes broadly webbed. Disks well developed.

Polypedates maculatus. Common Indian Tree-

Frog. *Gunth. Batrach. Gal.* p. 78.

Hyla maculata, *Gray. Ind. Zool.*

H. lencomystax, *Gravenh. Delic.* p. 26.

Polypedates leucomystax, *Dum. & Bibr.* viii. p.

519. *Cantor, Mal. Rept.* p. 142. *Kelaart. Prodr. Faun. Zeyl.* p. 193.

P. rugosus, part., *Dum. & Bibr.* viii. p. 520.

P. crniger, *Blyth, in Kelaart, Prodr. Faun Zeyl. App.* p. 48.

Ceylon, Sikkim, Penang, China, Siam. One of the most common frogs of Ceylon and of the continent of India. In the Himalaya (Sikkim) it ascends only to an altitude of 2,780 feet; and, singularly, in Pinang, it is absent in the valleys, whilst it occurs at an altitude of above 2,000 feet.

Polypedates quadrilineatus, *Gun. Bat. Sal.* 79.

Hyla quadrilineata, *Wieg. Act. A cad. Cœa. Leop. Carol.* 1835, p. 260.

Polypedates rugosus, part., *D. & B.* viii. 520.

Archipelago Java, (Philippine Islands), Penang and Singapore, largest 3 inches long the hind limb 5 inches.

Polypedates microtypanum, *Gunth. Batrach. Sal.* p. 77. Not uncommon in Ceylon, $2\frac{1}{2}$ inches.

Polypedates pleurostictus. From the Madras Presidency. The largest is 2 inches long.

Polypedates reticulatus. Similar in habit to *P. microtypanum* and *P. pleurostictus*, but readily distinguished by a peculiar coloration of the hinder part of the thighs, &c. It is $2\frac{1}{2}$ inches long; inhabits Ceylon.

Polypedates eques. *The Spurred Tree-Frog*. *Gunth. Batrach. Sal.* p. 80. Not rare in Ceylon, $2\frac{1}{2}$ inches long.

Polypedates afghana, *Gunth. Batrach. Sal.* p. 81. Afghanistan 3 inches long, hind limb 6 inches.

Ixalus, *Dum. & Bibr.* Skin smooth or tubercular; no glandular fold on the side of the back. Vomerine teeth absent. Tongue elongate and deeply notched behind. Tympanum distinct. Limbs of proportionate length; fingers quite free, toes more or less broadly webbed; disks of the fingers and toes well developed.

Ixalus variabilis, *Gunth. Batrach. Sal.* p. 74. Found in Ceylon only, is $1\frac{1}{2}$ inch long.

Ixalus temporalis. Whitish below, throat dotted with brown. Ceylon.

Ixalus femoralis. Ceylon, 13 lines long.

Rhacophorus, *Kuhl.* Slender in habit; skin smooth. Fingers and toes entirely webbed, with the terminal disks very large. Vomerine teeth in two series, separated by an interval, and situated on a level with the anterior

angle of the choanæ. Tongue large, elongate, free, and deeply notched behind. Tympanum distinct; openings of the eustachian tubes rather small. Males with a simple internal subgular sac.

Rhacophorus maximus, *Gunth. Bat. Sal.* 83.

? *Rhacophorus reinwardtii*, *D. & B. Atlas (not Bois.)*

Tympanum half the size of the eye. From Nepal and from Sikkim, where it extends to an altitude of 5,200 feet.

Hyla, *Dum. & Bibr.* Skin smooth, or with small tubercles; no large gland. Fingers and toes with the terminal disks well developed; toes webbed, fingers frequently connected with a more or less developed membrane. Tympanum distinct. Tongue large, subcircular, entire, or only slightly notched behind. Vomerine teeth present. Male with one or two vocal sacs.

Hyla chinensis.

Hyla arborea, var. *chinensis*, *Gunth, Bat. Sal.* 108. China, Formosa.

Callula, *Gray.* Head rather small, with short snout; body short, depressed; limbs short; cleft of the mouth narrow; eye rather small. Teeth none; a sharp osseous transverse ridge behind the choanæ; a fold of the mucous membrane runs across the palate, another further behind, before the œsophagus. Tongue free and entire behind. Openings of the eustachian tubes narrow; tympanum indistinct or hidden. Skin smooth, or with a few flat tubercles; no large glands. Males with a simple vocal sac, which opens by a pair of slits on the middle of the side of the tongue.

Callula pulchra, *Gunth.*

Kaloula pulchra, *Gr. Z. M.* 38. *Gunth. Bat. Sal.* 123.

Hylædactylus bivittatus, *Cunt. Mal. Rept.* 143.

Ceylon. Malay Peninsula, Pegu, Mergui, Gamboja, Siam, and China, rather more than 3 inches long.

The Order of Tailed Batrachians. *Batrachia Gradientia*.

Body elongate, terminating in a tail, with four or two limbs, lizard-like. The tailed Batrachians have small teeth in both jaws and on the palate.

Cynops, *Tschudi*. Head of moderate size, body not elongate, tail compressed. Parotoids present; body without series of pores on the side; skin granular. Palatine teeth in two longitudinal series, divergent behind. Tongue narrow, scarcely free on the edges. Limbs well developed, toes four in front and five behind. Two species are known, one from Japan and one from Northern China.

Cynops chinensis, *Gray. Proc. Zool. Soc.* 1859, p. 229. Captured in a river, inland from Ningpo; $5\frac{1}{2}$ inches long, the tail nearly 3 inches.

Plethodon, Tschudi. Head of moderate size; body cylindrical, more or less elongate; tail scarcely compressed. Parotoids none; body with vertical folds on the side; skin smooth. Vomerine teeth in a transverse series. Tongue more or less adherent to the bottom of the mouth. Toes four in front and five behind not clawed.

Plethodon persimilis, Gray. Proc. Zool. Soc. 1859, p. 230. Siam. 3 to 4 inches long.

The Order of Burrowing Batrachians, *Batrachia Apoda*.

Body long, cylindrical, without limbs, worm like tail absent or extremely short. They constantly live below ground, burrowing like worms; their food appears to consist of mould and worms. Only three species are known from British India; they belong to two genera:—

Epicrium, Wagl. A small round groove in front and below the eye, near the labial margin. Two species are known:—

Epicrium glutinosum, D. & B. viii. p. 286.

Serpens caecilia ceylonica, Seba, ii. p. 26.

Caecilia glutinosa, L. Mus. Ad. Fred. p. 19.

C. hypocyanea, Hasselt, Isis, 1827, p. 565.

Epicrium hasseltii (Pitz.), Wagl. Isis, 1828, 743.

Ceylon, Southern India, Khasya, Siam, Tenasserim, Java; length 15 inches, the greatest circumference of its body being $1\frac{1}{2}$ in.

Epicrium monochroum.

Isothyphopsis glutinosa, Can, Mal. Rept. var. p. 137.

Epicrium monochroum, Bluck. Nat. Tijdschr. Nederl. xvi. Hind. 1858, p. 188.

Singapore. W. Borneo. Length $9\frac{1}{2}$ in circumference $1\frac{1}{2}$ in.

Caecilia, Wagl. A small round groove below each nostril.

Caecilia oxyura, Dum. & Bibr. viii. p. 280. said to be from the coast of Malabar, about 12 inches long.

It is of interest to mention that the *Emys crassicolis, Bell, apud Gray*, feeds upon frogs and also upon shell-fish and animal offal. Old Malay women, who may be seen after every heavy fall of rain, spending hours, rod in hand, over the overflowing ditches, out of which their butts rise, are often ludicrously disappointed on perceiving this tortoise on the hook.

The *Emys platynota, Gray*, lived in Dr. Cantors garden at Penang, upwards of a twelve month, apparently without food, and it was never observed to enter a tank. The shell bears deep white marks of corrosion, in appearance like that observed in Testacea inhabiting stagnant water. The animal suffered itself to be touched with impunity, never offering to scratch or bite. This tortoise inhabits

the valleys, but is apparently not numerous at Penang.

The *Cistudo Amboinenses, Daudin*, is very timid, withdrawing its head and limbs when handled, though it neither bites nor scratches.

The *Tetraonyx affinis, Cantor*, was at different times found in fishing stakes placed along the sea-shore of Pinang; one was also taken out of the sea with a small hook, baited with a shrimp. The Malays assert that this tortoise also inhabits estuaries and rivers on the Peninsula, and that it grows to a considerable size. The young is very timid, withdrawing the head and extremities when touched.

The *Gymnopus gangeticus, Cuvier*, is of fierce habits, desperately defending itself by biting, emitting when excited a low, hoarse, cackling sound.

The *Gymnopus Indicus Gray*, is frequently taken in the fishing stakes at Pinang the Chinese inhabitants greatly relish this as well as the preceding species of *Gymnopus* as articles of food. Individuals weighing 240 lbs. occur in the Ganges, and others of gigantic dimensions are not uncommon at Pinang. It is very powerful, and of ferocious habits.

Chelonia virgata, Schweig. Is at all seasons plentifully taken in fishing stakes in the Straits of Malacca. It is the "Green Turtle" of the European inhabitants of the Malayan settlements, and of the seaports of India. In size it equals *Chelonia midas, Schweigger*, which it rivals in flavour. About December and January is the season when the female deposits her eggs in the sandy beach of some sequestered island, and then the fishermen watch during the moonlight nights to "turn turtles." The eggs are of a spherical shape, about one inch in diameter, covered by a soft hemitransparent membrane of a pale yellow colour. The expert eye of the fishermen baffles the pains with which the turtle conceals her eggs, and prodigious numbers are disinterred. They are very rich flavoured, like marrow, and will keep for weeks although exposed to the air.

Chelonia olivacea, Eschscholtz: The flesh of this turtle, though relished by the Chinese settlers, is unpalatable to Europeans.

The *Crocodylus vulgaris, Cuvier*.—inhabits not only rivers and estuaries, but also the sea coasts, and may in calm weather be seen floating at a distance of two to three miles from the shore. Although numerous at Pinang and the opposite coast, it appears to be less so than *Crocodylus biporcatus*. Fishermen while working the nets are not seldom attacked by crocodiles, and would, but for their presence of mind, oftener than

they do forfeit their lives. When seized they force the fingers into the eyes of the crocodile, which immediately lets go its victim, who is further rescued by his comrades—from 1842 to 1845 many persons lost their limbs from accidents of this description. Individuals 15 feet in length are not uncommon; some attaining to 20 feet and upwards are reported to occur.—In rivers a single one will often appropriate to himself a limited district, which if it happen to be in the vicinity of a village, will soon be perceived in the loss of the grazing cattle. Instances are on record of Malays, who, to avenge the loss of a relative, have watched the crocodile, and by diving from below, plunged a Kris into its heart. The eggs are white, the shell hard, of a cylindrical form, upwards of 3 inches in length, and about 1½ inch in diameter.

Platydictylus gecko, Linn. is the “To-ko” of the Malays. The Malays, denominate the family of Geckotidæ, *Gekko*, *Keko*, *Gago*, *Goko* evidently onomatopoiias, in imitation of the cry of these lizards.

Platydictylus monarchus Schlegel, inhabits the Malayan Peninsula, Pinang, Singapore, Philippine Islands, Amboyna, Borneo. The Malayan Geckonidæ have the power of somewhat changing the ground colour, none however in a greater degree than the present species. In the valley and on the hills of Pinang it is very numerous, swarming at night in rooms, on the walls, and under the ceiling, occasionally giving out a sound, resembling the monosyllable “Tok,” repeated six or eight times with increased celerity. The aim of these lizards is by no means unerring; they frequently miss an insect, and fall from the ceiling. Among themselves they are pugnacious, when two or more covet an insect, the successful one has to defend its prize or give it up to the stronger.

Ptychozoon homalacephalum, *Creveld*, inhabits Pinang Hills, Singapore, Java, and Ramree Island, in Arracan. A female while in Dr. Cantors possession refused insects and water. She deposited a single egg, of a spherical form, about half an inch in diameter soft, and of a yellowish white colour, which the following day she devoured.

Hemidactylus frenatus, *Schlegel*. Inhabits the Malayan Peninsula Pinang, Singapore, Amboyna, Timor, Java, Marianne Islands, Ceylon, Bengal. In the Malayan valleys and hills this small species is very numerous. It is of fierce habits, like several other Geckonidæ destroying its own species. Its normal colour appears to be greyish, which however it has in its power to change.

Varanus salvator Laurenti, Inhabits the Malayan Peninsula, Pinang, Philippine and Molucca Islands, Amboyna, Java, Bengal. It is very numerous both in hilly and marshy localities. During the day it is commonly observed in the branches of trees overhanging rivers, preying upon birds and their eggs, and smaller lizards, and when disturbed, it throws itself from a considerable height into the water.—When attacked on level ground, it attempts its escape by running, if possible towards the water. Its quickness however is not so great as to prevent a man from overtaking it, when it will courageously defend itself with teeth and claws and by strokes of the tail. The lowest castes of hindooes, capture these lizards commonly by digging them out of their burrows on the banks of rivers, for the sake of their flesh which by these people is greatly relished. Some individuals attain to nearly 7 feet in length, but the majority are smaller.

Bronchocela cristella, *Kuhl*, inhabits the Malayan Peninsula, Pinang, Singapore, Amboyna, Island of Buru, Java, Sumatra. It is very numerous in the Malayan countries both in the valleys and on the hills. It moves and leaps with great quickness among the branches of the trees. The most striking feature is the great power of suddenly changing its colours. The Malayan denomination of this species is “*Gruning*,” which Marsden’s in his Dictionary describes as a species of lizard which changes its colour as it is affected by fear or anger.

Lophyrus armatus Gray. Inhabits Pinang, Singapore, Cochin-China. At Pinang this species appears to be very local and not numerous: two individuals examined were obtained from spice plantations in the valley. They were very active and fierce, possessed in a slight degree the power of changing the ground colour to a lighter hue, and in captivity refused food and water.

Draco volans, *Linne*. Inhabits the Malayan Peninsula, Pinang, Philippine Islands, Borneo, Java. The transcendent beauty of its individually varying colours, baffles description. As the lizard lies in shade along the trunk of a tree, its colours at a distance appear like a mixture of brown and grey, and render it scarcely distinguishable from the bark. Thus it remains with no signs of life except the restless eyes, watching passing insects, which, suddenly expanding the wings, it seizes with a sometimes considerable, unerring leap. The Typhlopidae family of Ophidia are all of similar habits. They mostly live under ground, but appear occasionally in shady places, particularly after showers of rain, in

Bengal, in the rainy season. They are very agile, and appear to make use of the horny point of the tail as a propeller. When taken, they frequently press it against the hand in their attempts to escape. Reposing on the ground *Typhlops braminus* may easily be mistaken for an earthworm, until its serpentine movements, and the darting of the white furcated tongue, while the head and neck are raised, make it known. In confinement they refuse food and water. In all dissected, the stomach contained some earth; in a few, remains of insects, (myriapoda, ants.) A young female had a string of six cylindrical soft eggs, of a yellowish white colour, each about $\frac{3}{8}$ of an inch in length, $\frac{1}{8}$ in diameter.

Python reticulatus is very numerous in the Malayan hills, and valleys, feeding upon quadrupeds and birds. It often takes up its abode in out-houses, preying at night, and is thus useful in destroying vermin, although plunder is occasionally committed in poultry yards. Dr. Montgomerie had seen in George Town, Pinang, a young one which the inhabitants suffered to retain unmolested possession of the rice stores in order to secure them against the ravages of rats.

The *Lycodon effraenis*, *Cantor*, inhabits Pinang. In fierceness it resembles its congeners, but unlike them, it raises vertically the anterior part of the body, and bites after a few oscillating movements from side to side. *Lycodon platurinus*, and *aulicus*, like many other harmless, and some venomous serpents, the pupils of which are vertically closed by the light, prepare to attack horizontally coiled on the ground, with the head bent close to the body, and drawn as far backwards as possible, when, suddenly uncoiling the anterior part of the body, they dart obliquely upwards, but as they are blinded, not always in the direction apparently aimed at, and they frequently miss the aim.

The *Herpetodryas oxycephalus*, *Reinwardt*, is of Pinang, Java, Celebes. Its ferocious habits have been accurately described by M. Reinwardt. It has in a remarkable degree the power of laterally compressing the neck and the anterior part of the body, when the greyish blue skin becomes visible between the separated scales. In such state of excitement it raises nearly the anterior third vertically from the ground, continues fixed during several seconds with vibrating tongue, and bites. It then throws itself down, to rise to a renewed attack. A similar mode of attack characterizes *Dryinus nasutus*, *Lacopede*; *Prasinus*, *Reinwardt*; *Leptophis pictus* *Gmelin*, and *Leptophis caudolineatus*.

Spidonotus juncus, *Cantor* inhabits Pinang, and like most of the Asiatic species of this genus, is of fierce habits. It twice unprovokedly bit a woodcutter who happen to pass it. The bite, of course, was productive of no consequences except a slight momentary pain. The very slender make and the elongated tail are characters which approach this species to the arborial Colubridæ.

Bungarus species are not numerous in the Malayan countries but *B. candidus* and *fasciatus* are of no uncommon occurrence in Bengal and on the Coromandel Coast, where, however, it should be observed, a class of the natives ("serpent charmers,") earn a livelihood by capturing and exhibiting serpents; this craft is unknown among the Malays. *B. flaviceps*, *B. candidus* and *B. fasciatus* like the rest of the venomous serpents, are very ferocious when attacked, but unprovokedly they are not known to attack man: on the contrary, when met in the jungle, they attempt to escape. When trod upon, or struck, their rage is instantly excited, in self-defence they will even turn from their retreat, and then their habitual sluggishness is roused to furious activity. Preparing to attack, the head is, by a short curve of the neck, brought closely to the body, and drawn far backwards, when suddenly darting the anterior part of the body obliquely upwards, they bite. The height of the place where the wound is inflicted, of course depends on the length of the serpent, which is capable of darting nearly the anterior half of the body. Notwithstanding the circular pupil, they appear to shun the light, hiding the head under the folds of the body, and they are singularly uncertain in their movements, often suddenly jerking the head or tail without any apparent object. Like all serpents of tropical Asia, they seldom expose themselves to the sun: when during the day they leave their hiding places, they select the shade. The genus *Bungarus* is terrestrial, feeding on rats, mice, serpents, (*Col. mncosus*, *Lin.*) and toads. Like other venomous serpents, when the venom has been inflicted on their prey, they disengage it from the fangs, sheathe and place them as horizontally as possible, in order that they may offer no resistance to the introduction into the mouth of the lifeless prey, which is now seized head foremost. The innocuous serpents bite or strangle their prey, which when life is extinct is either swallowed at once, or if it happen to have been killed in a position, likely to render the deglutition difficult, is often disengaged from between the teeth, and seized a second time, by the head. In captivity these serpents refuse food, but greedily lap up and swallow water. A

fourteen minutes after it had on the inner side of the thigh, by a fang, fell on the wounded side, and was shortly after seized with slight purging. The eyes were half closed, the pupils alternately dilated and contracted, immobile. In 17 minutes slight spasms occurred, under which the bird expired 43 minutes after it had been wounded. Another fowl wounded in the same place as the former, by the same serpent, but after an interval of seven hours, expired under similar symptoms, only more violent spasms, in the course of 28 minutes. Venom taken from another serpent, the fangs of which had been extracted, was inoculated by a lancet-incision in the right thigh; four minutes after, the fowl was seized with trembling, fell, and remained lying on the wounded side, with the eyes closed, but it gradually recovered, and rose apparently recovered, 30 minutes after the inoculation of the venom. Other fowls were killed by different serpents of this species in 20 to 31 minutes. Fowls bitten by *Bungarus candidus* expired under similar symptoms, within 30 to 45 minutes; dogs from within 1 hour 10 minutes to 2 hours, under symptoms noted in Russell's Experiments; the venom of *Naja lutescens*, *Laurenti* was carefully obtained so as to avoid any admixture of saliva, by compressing the venomous glands. It issued from the lower aperture of the fangs in viscid drops of a syrupy consistency, and was received as it fell from the fangs in platina capsules. The serpents operated upon were an adult *Cobra de Capello* *Naja lutescens*, *Laurenti* and one of its varieties—*Naja Kaouthia Belangeri*. In every instance the venom readily changed the blue of litmus to red, and restored the bright yellow to turmeric paper that had been reddened by the application of caustic alkali; an unequivocal proof of acidity. When left to spontaneous evaporation, it dried into a varnish resembling mucilage, or the glare of an egg, cracking in all directions; and on being heated it deposited an abundant coagulum, apparently albuminous. In either instance when redissolved, it retained its acid property.

What the nature of this acid may be, it was impossible to determine from the small quantity operated upon; nor was Dr. Cantor prepared to say that the poison itself is an acid, although if it be not so, it is certainly associated with one. The poison itself probably consists of some compound, which would be wholly disorganised, under any attempts at detection by chemical means.

Trigonocephalus Sumatranus, Raffles Var., inhabits Pinang, Singapore, Penin-

sula. In Malayan countries this variety is not of so rare occurrence as the species appears to be in Sumatra. Both are equally dreaded. The natives of Sumatra denominate it, "Puchuk," a young, green shoot of a tree, a name expressive both of its color and arborial habits. The Malays of the Peninsula, who only know the black variety, call it from its broad cordate head the "hatchet shaped" serpent, "Kapak," or "Kapak," signifying an axe. At Pinang it generally occupies the lower parts of the hills or the valleys, either on the ground or on trees, but Dr. Montgomerie in one instance observed it at an elevation of 2,200 feet. It preys upon rats, small birds, tree-frogs. *Trigonocephalus puniceus* is general sluggish, but when roused, is of ferocious habits, *Tr. gramineus*, *Tr. sumatranus* and *Tr. puniceus* resemble the genus *Bungarus*; their mode of attack is also similar: like *Vipera Russellii*, Shaw, when it prepares to dart, they vibrate the prehensile tail, and utter a faint hissing sound. As the pupil is vertically contracted by the light, they frequently miss their aim, and like *Bungarus*, *Naja*, *Vipera Russellii* and *Hydrus*, in the extreme of fury, they will fix the fangs in their own bodies. Although they are averse to motion, they are not of quite so stationary habits as represented by M. Schlegel; Dr. Cantor in the jungle noticed them moving between the branches of trees or on the ground, either in search of prey, or after heavy rains had flooded their hiding places. In Bengal, most terrestrial serpents keep to the latter during the hot season, but the rains send them abroad in search of dry localities.

Although the present genus has venomous organs, as highly developed as *Crotalus* or *Vipera*, the effects produced by wounds of two species at least, appear to be less dangerous. According to Russell's experiments with the venom of *Trigonocephalus gramineus*, chickens expired within 8 to 33 minutes, Pigeons in 14 to 18 minutes. A pig recovered in 6 or 7 hours; dog in 2 to 3 hours, after having been wounded Mr. Hodgson has seen a man who was wounded by this species, the only venomous snake known to inhabit Nepal, fearfully suffering from pain and swelling, but he never heard of a fatal case.

A male *Trigonocephalus puniceus*, successively wounded two fowls, one in the chest, the other in the left thigh. In both cases the fangs of both sides acted, but neither of the birds experienced any other effect except a slight pain, which lasted a few minutes after they had been wounded. It should, however, be observed, that the serpent at the time had gorged itself with food, in which state it was observed close to the General Hospital, in the valley of Pinang. Another individual was subsequently caused to

wound a fowl on the inside of the thigh. The bird immediately drew up the wounded leg, fell down and was purged 8 minutes after being wounded. In 3 minutes more, slight spasms of the head and neck appeared at short intervals, but they ceased in 5 minutes, when the fowl made, at first, some unsuccessful attempts to rise. Twenty-one minutes after having been wounded, the bird rose, shook the wings, and had perfectly recovered. The same serpent subsequently was made to wound another fowl on the inside of the left thigh. The bird drew up the wounded leg, and was slightly purged, but showed no other inconvenience from the wound.

The following experiment was communicated by Dr. Montgomerie. An adult *Trigonocephalus sumatranus*, Var. was made to bite a fowl in the fleshy part of the thigh. The bird limped about for a short time, and a minute after it was wounded commenced purging. At the end of two minutes it fell, breathing labouriously and was strongly convulsed. At the end of 6 minutes a few drops of water exuded from the eyes; in fifteen seconds more it was quite dead, six minutes and a quarter after it had been wounded. Both fangs had acted, the wound was livid, and similar lines were observed in the course of the absorbents. On another occasion, after some unsuccessful attempts to make another individual bite a fowl, a terrier accidentally was wounded in the fleshy part of the fore-arm. The serpent fixed the fangs for an instant in the flesh; the dog pitifully screaming, jumped and shook it off. A ligature was immediately applied above the elbow, and the dog secured in a cage. It continued for some time whining from pain, probably aggravated by the tight ligature, which was removed at the close of half an hour, and the dog let free. In a short time it had regained the free use of the limb and was apparently well. But on the third day following a perfectly circular slough, including the bitten spot, of about $\frac{3}{4}$ of an inch in diameter, was thrown off, the sore readily healed up and the dog suffered no further inconvenience.

All the hitherto known species of pelagic serpents, have been observed at Pinang, among the abundant supply of fishes daily carried to the markets. Of their general habits some account appears in the *Transactions of the Zoological Society, London, Vol. II, p. 303*. One of them, *Hydrus schistosus*, is incredibly numerous in the Bay of Bengal, at Penang and Singapore, far more so than any known terrestrial serpent. The fishing nets are hardly ever worked, but that one or more are among the contents. Other six species are of rare occurrence at

Penang and Singapore, as will be perceived from the disproportionately small number of each, examined during four years, viz. of *Laticauda scutata* 3; *Hydrus striatus* 2; *nigrocinctus* 6; *gracilis* 7; *pelamoides* 4; *pelamus* 1.—Of these *Laticauda scutata* is excessively numerous in Timor. *Hydrus pelamis* in New Guinea, the Molucca Islands, and Otaheite, where the natives use it as an article of food. The remaining species, so far as is known, have been observed nowhere in such overwhelming numbers. Large individuals of every species are very seldom seen, it is the young individuals which frequent the coast, and it appears to be questionable, if even the largest observed are animals arrived at their full size. The large individuals are very ferocious; the young ones are less so. Fortunately for the fishermen the light blinds these serpents, which when out of their proper element, become very sluggish and soon expire. This accounts for the safety of the class of men, whose daily calling brings them in immediate contact with animals, the wound of which is fatal. The fishermen in the Straits of Malacca are aware of their danger, and therefore take care to avoid or destroy these reptiles while landing the fishes. The Malays denominate them "Ular laut," i. e. serpents of the sea; among which, however, the innocuous *Acrochordus granulatus*, (Schneider), is also comprised as an inhabitant of the coasts.—*Transactions Zoological Society, London, Vol. II, page 309*.

Crocodilus porosus. Schn. This, the larger and fiercer of the two crocodiles, is found in various localities both on the East and West Coasts of the Peninsula of India and is the species that was so abundant in the fort ditch at Vellore. It is of very rapid growth. An egg brought from Vellore to Mr Walter Elliot, was hatched in the Government house compound, and in eight years the crocodile had increased to the length of 8 or 9 feet, becoming so powerful as to destroy a full grown buck antelope which had come to drink water at the tank where it usually resorted. Both species of crocodile are called alligators by the English in India; erroneously so, of course, as no alligators have as yet been found in the old world.

Calotes versicolor. Daud.

Agama Friedmannii, ... Kuhl | *A. culturosa*, ... Harl. This has two spines on each side of the nape. No fold on the neck. Tail conical. Scales large, keeled. It is the most common and extensively distributed lizard in British India being found everywhere in gardens, avenues and jungles. Though not a chameleon in structure, it is yet one in habit, and much more so than the

Indian chameleon. Its usual tints are a pale drab or fawn colour, but this it changes to bright red, to black and to a mixture of yellow, red and black. This change is sometimes confined to the head, at other times diffused over the whole body and tail. A common state to see it in, is seated on a hedge or bush with the tail and limbs black, head and neck yellow picked out with red, and the rest of the body red. This display of colours seems merely seasonal. It only occurs in the males, the females being uniformly and plainly coloured. The young has a pale band on each side of the body from the eye to the tail, and a series of dark bands on the back. And some which Dr. Kelaart sent alive from Ceylon were identical with the Bengal reptile. It is chiefly during the months of May and June that the species displays its fine colours; which generally are—head and neck, and more or less of the fore-part of the body, bright red; rest of body and limbs dark greenish-brown; and a great black patch on the shoulder. The female is smaller, and deposits her 8 to 16 eggs very commonly in a flower-pot, burrowing 4 or 5 inches into the hard dry soil, and finally covering them up most carefully, so that no appearance remains of the ground having been disturbed. The young appear in about 8 or 9 weeks. Mr. Blyth had seen a two-thirds grown lizard of this species carry off and partly swallow a *Scolopendra* nearly of its own length. This and the other species of *Calotes* are essentially tree lizards, seeking their prey often on the ground, but always retreating up trees when in danger.

Sitana ponticeriana, Cuv. Fawn-coloured, rhomboidal dark spots on the back, and a pale longitudinal streak from ear to tail. Male, in breeding season, with a large tri-coloured dewlap. This common ground lizard is distributed over all India, but is rare in the wooded districts, frequenting the open country, field and low copses: on the approach of danger, it runs with great rapidity, tail erect, and conceals itself in any crack in the ground or hole, or under a stone or bush. Notwithstanding its activity, it is the common prey of harriers, buzzards, hawks and eagles. Dr. Jerdon had not seen the beautiful dewlap (blue, black, and red) developed in the south of India, nearly to the extent that appears to take place in the north, and there it attains a greater size. The colours of the dewlap are only exhibited during the pairing season, and it then becomes larger than previously. At this time, too, some blue marks are observable on the nape and back, that on the nape indeed forming a kind of crest more conspicuous now, the colours in general too are deepened, and the qua-

drangular marks on the back and barring of the limbs very distinct. The name *Sitana*, said by Cuvier to be the name by which it is known at Pondicherry, is a Latin termination of the word *Shaitan* or Devil, a name sometimes applied to it by the mussulmans of S. India.

Draco dussumierii—Dum. & Bibr. The anterior and posterior angles of each orbit edged by a small pointed horn; gray, wings marked black and red. This very beautiful little lizard is only found in the forests of the West Coast, or rather in the neighbourhood of the forests, for it frequents cocoanut and betel-nut plantations, in their vicinity chiefly, not living, it is alleged, in the woods themselves, nor in the gardens at any distance from the forest. It is tolerably common in all Malabar, Cochin and Travancore, but not known farther north than Malabar, being either unknown or very rare in Canara. The colour of the body is a delicate grey, with some darker markings, which the animal occasionally renders very distinct, at other times obscures entirely. It sometimes also changes its whole hue to a dark blackish grey. The ground colour of the wings is red marbled with black and edged with yellow. The small dewlap is pale yellow marbled with green at the base. This is never extended forwards to the extent usually seen in stuffed specimens, being merely brought forward now and then to the edge of the chin, and in a flat state not distended with air. The two lateral appendages of the head, also, are merely slightly raised now and then and never distended in the manner seen in dried specimens.

Agama dorsalis—Gray. This large rock lizard is only partially distributed in Southern India and is only found at some elevation above the sea. It is most abundant in Mysore, and especially so in the neighbourhood of Bangalore, where it may be seen on every bare rock. It is also not uncommon on the edges of the Neilgherries up to the height of nearly 6,000 feet. Its normal colour and that of the female at all times is a dusky grey with dark markings. The male can assume a very bright live fine vermilion red above, with a streak the eye; under surface, limbs and tail black; occasionally the red is exchanged for yellow. It frequents bare rocks only, and retreats into holes and clefts on the approach of danger.

Varanus dracaena. L. This monitor appears generally spread throughout the whole of British India and it is said to extend into the island of Ceylon. It is chiefly nocturnal in its habits and frequents jungly places. It is by no means confined to the neighbourhood of water, though perhaps it prefers such a locality. It defends itself

most vigorously by striking with its tail. It can climb well both trees and walls, and it is popularly believed, that thieves make use of it to effect an entrance into a building or over a wall by allowing the guana to get hold by its fore-claws of the window sill or wall and pulling themselves up by it. It is eaten by the natives, who consider it highly nourishing and aphrodisiac, and many Europeans use it for soup, imagining it allied to the west Indian Guana. It can always be procured in the Madras market.

Tiliqua rufescens, Merr. This is the most common scink in the country, being universally dispersed throughout India, hiding itself under leaves, rubbish, stones, in dark rooms, &c. It runs with some rapidity, and is very active.

Vipera. Russellii.—Gray, Russell.

"Kunnadi vyrien" Tam.

This well known and justly dreaded snake grows to a large size, the far-famed *Cobra monil*, or *Cobra manilla* of some, seems merely the young of this species. The old orthography is *monil*, which simply means a chain or necklace, and whoever looks at the markings of this snake especially of the young one, must be struck with the resemblance thereof to a necklace. *Cobra capella* and *Cobra monil* are Portuguese names, and there is little doubt, that the latter name was given to present species by the Portuguese. It has however been forgotten as applied to this viper, and may now be considered a fable; every one you meet is able, on his own showing, to point you out the real *cobra monil*, as quite distinct, and no two observers describe it alike, they only agree in its being a very deadly snake. The *carpet snake*, another household word in the Madras army, appears to be equally fabulous, several prettily marked innocent species having been, at different times pointed out as the carpet snake. Generally, the little harmless *Lycodon aulicus* and this, perhaps, from its habit of entering houses as much as from its markings.

—*Cur. As. Soc.*

Vipera cohis.—Schlegel, V. naratta—Shaw, Russell.

"Kattavyrien," Tam.

This little snake is very common in the Carnatic. Jerdon doubts that its bite would prove fatal to man. A dog bitten by one recovered. Of all the venomous land snakes met with in Southern India, the only ones at all common are the Cobra, the Chain Viper (*Vipera Russellii*), the *Bungarus candidus*, and the little *Vipera cohis*. Most of the others are peculiar to the forests of India. *Trigonocephali* are not usually fatal. Jerdon had known several cases of bites by *Trigonocephalus malabaricus* and *Trig. nepa*; and

none proved fatal. Great pain is experienced, and swelling usually follows, but the patient gradually recovers. Jerdon was bitten in the fore-finger by the *Trigonocephalus neelgherriensis*; he applied a ligature round the finger, and sucked the wound vigorously. In a minute or so the skin round the bite blackened, and in a minute or two more a perfectly circular bit of the skin came off in his mouth, he set off running immediately he was bitten, and felt no further ill effects. See Cantor's remarks on the bite of *Trig. Sumatranus*, in Journ. As. Soc. Calcutta, xvi. 1044-6; also Blyth, *ibid.* xx. 524.

The great Seychelle Tortoise is miscalled T. Indica by Gmelin, and under that name Mr. Gray unites no fewer than seven of the supposed species admitted by M.M. Dumeril and Bibron. According to Dr. Schlegel, the Indian Tortoise probably indigenous to Madagascar and the neighbouring isles, has been acclimated in the Gallapagos Isles, in California, and on several other points on the western coast of South America:" but Blyth had been assured, on good authority, that numerous specimens kept in gardens in the Mauritius, have all been brought from the Seychelle Islands in the first instance, that they are still commonly brought from those islands to the Mauritius, and thence we believe the few in India have been imported. It is most assuredly not an Indian reptile, nor had he heard of its ever propagating in this country. The largest seen in India measures 4 ft. 4 in. in length over the curve of the carapax, or 3 ft. 5 in. in a straight line; transversely 4 ft. 2 in. over the high arch of the carapax, or in a diameter line 2 ft. 2 in. height, when not raised upon the legs, i. e. height of shell, 20½ in.; when walking, the shell is lifted fully 6 in. from the ground, if not more: circumference of hind-foot 17½ in. A scientific person recently from Jamaica, said that this great Seychelles species is quite distinct from the great Gallapagos Tortoise, which has bred and multiplied in Jamaica & other W. India islands. It is curious that these gigantic land tortoises (diminutive, however, in comparison with the extinct Indian *Colossocheilia*) should thus be indigenous to small Oceanic groups of islands, in each case remarkable for the peculiarities of both their *fauna* and *flora*. We are reminded of the great wingless birds (*Dodas* and *Solitares*) of the Mauritius, Bourbon, and Rodrigues; those also of N. Zealand and of Madagascar; the *Megapodius* of the Nicobars, and its congeners of other islands; the singular and quite recently extinct great Parrot of Philip Islet near Norfolk island, with its sole congener in N. Zealand, the Owl like nocturnal Cockatoo

of N. Zealand, also close upon extirpation, &c. The majority, if not all, of these islands appearing to be remnants of what may be comparatively termed continents, each with its peculiar centre or centres of creation. In all these supposed reliques of ancient lands, with the chief exception of Madagascar, mamalia are rare, and are chiefly or wholly *Cheiroptera*, *Rodentia*, *Marsupialia*; the two former orders comprising the only placental mamalia of Australia; and one species of each of these placental orders being the only known indigenous mammals of N. Zealand, though a large badger-like animal has lately been reported in the latter country, in all probability a marsupial. Madagascar is very remarkable for the extraordinary development of the quadrumanous group of Lemurs, among the higher placental mamalia; and has even a rodent Lemur in *Cheiromys*, as Australia has a rodent marsupial in *Phascalomys*. Its other placental mammals are mostly of peculiar genera, unknown even on the neighbouring continent of Africa and no marsupial has been discovered there.

The common Crocodile of the Nile, the eviathan of the book of Job, is one of the species common in Tenasserim waters, and the other species is very slightly distinguished from it. Crocodiles are numerous in all its tide-water streams. During a two hours' pull up a small river, Mr. Mason once counted fourteen sunning themselves on the mud-banks. They often carry off the natives, and a single animal emboldened by his successes, will usurp dominion over a particular portion of a river, where he becomes the terror of every boat's crew that passes. The steersman occupies the most dangerous position; for the crocodile's mode of attack is to glide up silently to the bow or stern of a boat, then turn suddenly, when with one stroke of his powerful tail, close to the top of the boat, he sweeps into the water, whoever is within its reach, and the stunned victim becomes an easy prey. A Karen chief with whom Mr. Mason was acquainted, perished in this way at a point in the river Gaing, which had previously been known as the desmeane of one of these river monarchs. Persons sleeping on their boats moored to the shore, have sometimes awoken in the jaws of these monsters and one carried off a Burman from the back of a buffalo that he was riding across a small stream, under the very shadow of the walls of Tavoy.

The large gecko, which the Burmese call *tonkay*, and the Malays *toke*, in imitation of the sound it makes, is very abundant. It disputes the possession of every cranny with the rats, and sometimes it is thought, devours their

young. It has been seen making its repast on the small gecko. The natives think it noxious, and always avoid the reptile. According to Dr. Cantor, it is the Indian salamander of old writers; and new comers usually bottle up a few individuals to send to their friends as specimens of the rare, and unknown productions of the East, not aware that it was well described, and figured by the Catholic missionaries in Siam during the reign of Louis XIV.

Hemidactylus coctai the common gecko, or small gecko, so abundant in Tenasserim houses, differs generically from *Platydictylus* gecko, in having the "basal joint of four or five of the toes in each foot forming an oval disk." It is identical with the gecko seen in the houses in Calcutta. The spider of the English bible, Proverbs xxx. 28, was undoubtedly a small gecko represented by this species and the word was so rendered in the Syriac version made in the second century, and in the Vulgate Latin made in the fourth century. Jerome translated: "Stellio manibus nititur, Et moratur in ædibus regis," into

"The gecko taketh hold with her hands

And dwelleth in king's palaces."

Robinson says the opinion of the celebrated Bochart, that the newt, a species of small lizard, is meant, seems in every respect entitled to the preference i. e. to that of spider, but it is the gecko that takes hold with her flat fingers, and odious as are her looks, dwells even in the palaces of kings. The word rendered "ferret" in our version, is supposed to be a different name for this same animal, and in the Samaritan Pentateuch the Hebrew word is the same in both passage.

Varanus bengalensis; the Karen are extravagantly fond of their flesh, they steal up the trees with a noose at the end of a bamboo, and often noose them while leaping for the water, or catch them on the boat which is brought under the tree. The head of this species, the natives say, is venomous, and they discard it altogether; but the flesh of the other parts, which smells most odiously, is deemed by the Karens much preferable to fowls.

The incantation of serpents has usually been attributed to the power of music, and a late writer remarks that "it is so strange that many have denied the fact, while others have asserted it to be a deception." "Our own conviction," he adds, "is, that serpents are extremely sensitive of impressions from musical notes, or modulations, under the influence of which they wreath their bodies from feelings of pleasure, while to these graceful contortions and undulating movements, the charmer, who plays on a pipe or some simple instrument, adapts the time." This is the common theory,

REPTILES.

REPTILES.

—that serpents are rendered docile by music. but Mr. Mason has seen the cobra dance in imitation of its Burmese master, while he sat upon his haunches before it, making the motions with his body and hands that he wished the snakes to imitate, and which it did perfectly without any music whatever, or any other sound except an occasional authoritative *hay* ! A pair of cobras kept perfect time with their master, while no sounds were uttered and allowed him to handle them as he wished. At his command they danced, and at his command they lay gracefully down as if asleep. The Burmese usually put a wild one, which they secure when half or two thirds grown, with a practised tame one. These will dance and wreath themselves at their master's pleasure. Sometimes darting at him but at that moment he straightens himself up, with his eyes fastened upon the snake's eyes, and in a gruff voice commands them to perform. Following his motions, they stand almost upright with their hoods dilated and their colours all in play as they dance ; now swift—now slow—now approaching—now receding ;—and he has seen the younger in his receding moments give unequivocal tokens of desiring to make his exit : but on hearing his master's call he turned again though evidently with more reluctance than the old actress. The power of effecting all this is certainly attributable neither to magic nor music. It must, he thinks, be ascribed to fear, and to a very simple principle—the power of imitation ; a power possessed by different animals in different degrees. Serpents are by no means

the least docile of the animal kingdom ; nor are cobras the most intractable of serpents, of ; the cobra, and the bungarus, being the favourites with the snake charmers.

Fire Serpent. The Elaps is perhaps the “ fire serpent ” of the Karen so called from the burning produced by its bite, which they say is poisonous, but not fatal. It is the smallest poisonous serpent in Tenasserim. According to the Burmese it has a more wonderful power of reproducing itself than the hydra of antiquity. They say if one be killed, two or three others immediately arise in its place, and a Burman, assured Mr. Mason that he once killed one, and immediately he saw two others, close by the dead one without being able to conjecture whence they came. Its Burman name signifies the father of many.

A large python, usually called a boa, is not uncommon in Tenasserim. Mr. Mason had seen the head of one that was killed by a drove of hogs whose whole length measured eighteen feet, and the natives say they grow much larger. The Karens have an apothegm that the largest python can swallow a full grown buck-rusa or sambur deer, horns and all, without inconvenience. They are often seen coiled up among the branches of trees, on the banks of streams in the interior, where they are frequently noosed by Karens, who regard them as valuable food. He has seen a Karen seize one nine feet long by the tail in the water, and with the aid of his associates succeed in capturing him.

Resinous substances are found in greater or less abundance in most plants. Many of the resins exude naturally from fissures in the bark or in the wood, or they are obtained from incisions made in certain trees and shrubs. As they exude they are commonly mixed with an essential oil, which either evaporates on coming in contact with the air, or is resinified by the action of oxygen. Such mixtures of volatile or essential oil with resins are sometimes called *balsams*. When gum is mixed with resins another class of substances is produced, called *gum-resins*. The resins when pure and free from essential oil have no odour except when rubbed or heated. Their colours are pale, yellow or brown; they are good insulators, and become electric by friction. Most of them are heavier than water and insoluble in that fluid; they have little or no taste but those which have distinctive flavours derive them from minute portions of some non-resinous body. They are usually softened or even fused by being boiled in water, and some of them in such a case pass into hydrates. They are inflammable, burning in the air with a sooty flame, and yielding by dry distillation volatile liquids and inflammable gases. The natural resins are usually composed of two or more resinous substances which may be separated by the action of alcohol, in which most resins are soluble. When pure, they are soluble in alcohol and in oils, but not in water, in which respect they differ from gums. They are also mostly soluble in ether, in sulphuret of carbon, and in the fatty and volatile oils. Resins are

solid, brittle, of a certain degree of transparency, and a colour commonly inclining to yellow. They are more or less acted upon by the alkalis. The generally known Indian resins, gum resins and balsams, are,

The most important of all the solid resins produced in the East Indies are those which are included under the general name of "Dammer." The whole of the substances commonly called "Dammers," produced in the Madras presidency are obtained from trees of the genera *Vateria*, *Canarium*, and *Shorea* or *Vatica*. The two former, viz. *Vateria*, and *Canarium*, yield by far the largest part (if not the whole) of the dammers produced on the Western coast of the Peninsula, whilst the *Shorea* or *Vatica* trees yield the greater part of that collected in the northern and eastern districts.

Black Dammer of the Western Coast is the product of the *Canarium strictum*, the *Karpoo coonghilum* of Ainslie, the *Dammara nigra legitima* of Rumphius and the *Canari* of the Malays. This occurs in large stalactytic-shaped masses, of a bright shining black color when viewed from a distance, but translucent and of a deep reddish brown when held in thin laminae between the eye and the light. It is perfectly homogenous, and has a vitreous fracture. Its shape appears to be due to the fact of the balsam having exuded in a very fluid state and trickled down the trunk of the tree, where it gradually hardens by exposure to the sun, the fresh resin continuing to flow over that already hardened, gives rise to the stalactytic appearance of the huge lumps of

resin, the outside of which much resembles the guttering of wax caused by placing a lighted candle in a draught. It is insoluble in cold, but partially soluble in boiling alcohol, on the addition of camphor: when powdered it is readily soluble in oil of turpentine. Powdered and burnt on the fire it emits a more resinous smell and burns with more smoke than white dammer. The size of the lumps of this resin, together with its color and the peculiarity of shape already mentioned suffice to distinguish it from other Indian resins.

White Dammer of the Western Coast of India, or Piney resin is from the *Vateria indica* and allied species of Linnæus and Wight, the *Chloroxylon dupada* of Buchanan and Ainslie, the *Doopada* resin of Mysore, and the Payanee or Piney of the Malabar people.

Vateria Indica...Linn. | *Chloroxylon dupada*. Han.
 Piney maram...TAM. | Chadacula...TAM.
 Dupa maram...CAM. | Payanee...MALABAR.

This is a very large and stately tree, a native of Malabar, and Mysore. The young shoots and all tender parts except the leaves are covered with fine stellate pubescence, leaves alternate, petioled, oblong, entire, from emarginate to obtuse, pointed, smooth, coriaceous, from four to eight inches long and two to four broad, petioles round, about an inch long; stipules oblong, panicles terminal, ramifications rather remote; flowers rather remote, pedicelled, pretty large; bractes oblong, one flowered; calyx five, cleft to the base, divisions oblong, obtuse, villous on the outside, corolla five petalled, petals oval, emarginate, broader but very little longer than divisions of the calyx, filaments from 40 to 50, short, broad inserted between the petals and the base of the germ, anthers linear with a single filiform beak; germ superior, conic, downy, three celled, cells containing 3 ovules each, attached to the top of the axis, style longer than the stamens, stigma acute, pericarpium acoriaceous, fleshy, oblong, obtuse, one-celled, three-valved capsule, general size about 2½ inches long and 1½ in diameter, seed solitary of same shape as the capsule. The substance called "East Indian copal" and sold in England as gum anime exudes abundantly from this tree. It occurs of all shades of color between pale green and deep yellow; the finest pieces are called kahruba, or amber, and sold as amber in the bazars of Bengal; the resin before it hardens is the Piney varnish of Malabar. Besides the uses already alluded to, candles are made of this resin in Malabar, which Dr. Wight informs us, diffuse, in burning an agreeable fragrance, give a fine clear light, with little smoke, and consume the wick without snuffing. These candles were at one time introduced into England, but a very

high duty having been imposed, the trade ceased.

One variety of it, is the Compact Piney resin or first sort white dammer, of the Western Coast, and occurs in large lumps of all shapes and varying in color on the outside from a bright orange to a dull yellow, bearing evident marks of having adhered to the bark of the tree. It has a shining vitreous fracture, is very hard and bears a great resemblance to amber. Its color (internally) is of all shades, from a light green to a light yellow, the green tint predominating in the generality of specimens. It is more soluble in alcohol than black dammer, and burns with less smoke and a more agreeable odour. It is easily distinguishable from all other Indian resins by its superior hardness, its colour and amber like appearance.

A second variety the Cellular Piney resin, or second or white dammer of the Western Coast, occurs either in small lumps or in large masses, generally of a shining appearance and balsamic smell and has a very cellular structure, which is attributable partly to the mode of collection, and partly to the age of the tree. Notches being cut in the trunk of the tree sloping inwards and downwards, the resin collects in the cavity and is either permitted to dry on the spot, or is collected and dried by the application of heat. It is of all shades from light green, to light yellow or white, and is usually translucent. Specimens are sometimes seen, in which, from the dessiccation having been irregularly conducted, the resin is more opaque, of a dull green color and full of air bubbles, presenting the appearance of having undergone a partial fermentation. This kind of resin may be recognized by its cellular appearance and balsamic smell—this latter, however, which is of course due to the volatile oil it contains, is gradually lost by long keeping or constant exposure to the air. On splitting open old and decayed trees portions of a dark colored resin, are often found having the solid consistence of first variety, but the inferior quality of the second. The inspissated juice of the *Vateria indica* tree is used for mixing with bees' wax in making candles. The fresh resin is called Pynie varnish. It is of a light grey colour, with a strong balsamic odour. The resin which first exudes is called "Chengilium" (this is white), that which flows subsequently is termed "Coongilium" (darker than the above), and when dried it is called Dammer (black.) He describes the three sorts as being the produce of the Paynee or *Vateria indica* tree.

Dammers of the northern and eastern Districts are the saul tree dammer, from *Shorea robusta* and other species. The *Shorea robusta* or Saul tree, of great size, is a native of Morung, the Paulghaut mountains, Northern Circars, &c.,

Calyx 5 sepalled, sepals afterwards changing into five long wings, petals 5, stamens 15, filaments capillary below the anthers, anther cell short, obtuse, connectum filiform, produced beyond the cells into a more or less elongated colored, deciduous, bristle, ovary 3 celled, with two pendulous ovules in each cell. Seed solitary, cotyledons stalked, not crumpled, radicle superior, leaves coriaceous, oblong, obtuse, often emarginate at the base, panicles numerous from the axils of the fallen leaves, branches and pedicels glabrous.

The *Shorea robusta*, and indeed some other species, yield abundance of the resin called dammer, the superior kinds of which are efficient substitutes for the pine resin of the European Pharmacopœia. Captain Jenkins of Assam forwarded specimens of this resin perfectly transparent and colorless; in the bazaars, the color ranges from pale amber to dark brown. It is devoid of taste and smell. Sp. gr. 1.097 to 1.123, easily fusible, partially soluble in alcohol (83.1 per 1000), almost entirely in ether, perfectly in oil of turpentine and the fixed oils; sulphuric acid dissolves, and gives it a red color. Two parts of colorless dammer and $2\frac{1}{2}$ parts of oil of turpentine, make the best varnish for lithographic drawings. This occurs in sticks much resembling in shape the black dammer, but differing widely in colour and consistency. In colour it varies from a light yellow to a dark brown, the two colours being very frequently blended in the same lump and giving it the appearance of having a regular "grain." It is friable and differs from the white dammer of the Western Coast in its inferior hardness, its opacity and its peculiar form, and from the black dammer in its colour. There are extensive tracts of Googulam (*Vatica*) jungles in the Goomsur and Cuttack provinces. The Khond and Urya races living in and near these jungles wound trees in several places. The resin issues and is collected when sufficiently solid. The dammer collected from the decayed parts of the tree is of a dark color, the tree is called "Guggilam" in Telugu and "Tala gotso" in Urya. The Khond and Urya races make the leaves into plates from which they eat their food, and also roll up tobacco in them to smoke like a cheroot. In time of famine the above tribes live on a soup made from the fruit of this tree. The dammer of the Northern Circars is chiefly produced by the varieties of the genus *Shorea*. The *Shorea* are also found growing, to a very limited extent on the Western coast, but do not appear to produce much, if indeed any, of the resin collected for sale. (*Koxb. Fl. Ind. Vol. iii, p 137.*)

Canarium commune, is a native of the continent of India, the Archipelago and Isle of

France, where it is called "Bois de Colophane." It was brought from the Moluccas to the Calcutta Botanic garden, but in Roxburgh's time did not thrive, owing to the coldness of the winter months. The bark yields an abundance of limpid oil with a pungent turpentine smell, congealing into a buttery camphoraceous mass.

Canarium Bengalense, is a native of Sylhet and the adjacent mountainous countries. It flowers in May and June, yields a large quantity of very pure, clear, amber-colored resin which soon becomes hard and brittle, and is not unlike copal; yet the natives of Northern India are said set little or no value upon it. In the Calcutta bazaar it sells at 2 to 3 Rs. per maund of 86 lbs.

Dipterocarpeæ. The trees of this order growing in Madras are all natives of the hilly tracts of the Balaghaunt. In Sylhet, Chittagong and Pegu where they abound, they occupy the plains. In Java, one species, the *Dipterocarpus littoralis*, is found on the sea shore. A *Hopea* and the *Vateria indica* also approach the coast in Malabar, but the latter, or perhaps a distinct species, is also plentiful in Mysore. Two or three species are found in Goomsur, forming extensive forests, and affording to the inhabitants incense, dammer and wood oil.

Doona Zeylanica, Thwaites, *Doona* dammer, is obtained from a *Dipterocarpus* tree, the *Doona Zeylanica*. In colour and appearance it much resembles pine resin.

Poon-yet—is a curious substance of Burmah, produced by a species of hymenopterous insect in holes in the ground and hollow trees. Its cellular structure much resembles that of a wasp's nest. On the western coast of India, a species of bee is exceedingly fond of the liquid dammer of the *Canarium*, this insect lives in holes in the ground, and it will probably be found on inspection that its cells are composed of a similar substance to the Poonyet.

Kino, from the *Pterocarpus marsupium*, is of a vitreous fracture and very deep red colour approaching to black.

Dragon's blood, lump and in reed, is used as a pigment.

Pulas or *Dhak kino*, is from *Butea frondosa*.

Dikkamulay, resin, from *Gardenia lucida*,

Benjamin of Siam, appears to be superior in fragrance to the Sumatra product, although both possess a delightful aroma, they are of the amygdaloid kind, the latter being almost entirely composed of agglutinated white tears.

Gunda feroza, from *Boswellia thurifera*, is largely used in India as an application to indolent ulcers and wounds and is supposed to form the chief ingredient of "Wroughton's ointment." It has the odour, taste and consistence of a balsam.

Theetsee is from *Melanorrhœa usitata*.

Xanthoxylon triphyllum. The resin obtained from this tree appears to be produced in too small quantities to be useful in a commercial point of view.

Semicarpus anacardium. The pericarp yields a resinous juice which is known as the black varnish of Sylhet. The black varnish of Malabar is from *Holigarna longifolia*; in China and Siam, *Augia Chinensis* yields a varnish, and in Japan, black varnishes are obtained from three species of *Rhus*, *R. vernix*, *R. succaeaneum* and *R. verniciferum*. In India, a varnish is obtained from the *Buchanania latifolia*, and another from the *Odina wodier*: the Martaban varnish is obtained from *Melanorrhæa usitatissima*. *Stagmaria vernicifolia* yields the Japan lacquer.

The *rosin* or *common resin* of Europe is obtained as a residuary matter in the process for obtaining oil of turpentine. Turpentine must be regarded as an oleo-resin. In their natural state resins are either solid or semi-fluid, the oil of turpentine being obtained by distillation of American turpentine with water. In the United States turpentine is procured "from the *Pinus palustris*: partly also from the *Pinus tæda* and perhaps some other species inhabiting the southern States. In former times large quantities were collected in New England; but the turpentine trees of that section of the Union are said to be nearly exhausted; and European commerce is almost exclusively supplied from North Carolina and the south-eastern part of Virginia. In collecting this turpentine a hollow is cut in the tree a few inches above the ground, and the bark removed for the space of about eighteen inches above it. The turpentine runs into this excavation from about March to October; more rapidly, of course, during the warmer months. It is transferred from these hollows into casks. Old and concrete American turpentine is often sold as frankincense Resins soluble in spirit of turpentine, are used for the most part in preparing dyes, varnishes, lacquers, sealing wax, &c., &c. *Guggilam* or *Bdellium*, is the same name as *Gugal*, and in combination when applied to a tree, indicates particular plants as *Guggilam chettu*, *Ægiceras fragrans*, *Kon*. *Guggulu* or *Sala*, is *Vatica robusta* and *Gugilapu chettu*, is *Boswellia glabra*. The combinations of the word *Gugal*, being applied to trees yielding resins.—*Elliot Fl. Andhr.* *Lt. Hawkes in M. E. J. R.*

REVENUE BOARD. In British India, in Calcutta and Madras, a Board of three Members who control the revenues of the country. There is no Revenue Board in Bombay, but there are two Revenue Commissioners, between whom the Collectorates are divided. The Revenue Commissioner there corresponds immediately with Government and is also Police Commissioner of his Division.

REWAH. The head quarters of the feudatory territory, consisting of 71 states, supervised by the Central Indian Agency, at Indore, forms three grand divisions. The north-east division comprises the native states of Bundelcund and Rewah. The Northern division consists of the northern and central districts of the Gwalior States. The south-west division comprises the table land known in modern times as Malwa, though far within the ancient limits of the province of that name, and the submontane territory between it and the Nerbudda, as also a considerable tract south of that river, extending to the Kandesh frontier. The first, extending from the Bengal Presidency in the east, to the Gwalior State in the west, includes Rewah and 35 other states and petty chiefships. Its area is about 22,400 square miles; its population about 3,170,000 souls, and its public

revenues aggregate about Rupees 63,58,000. The 2nd or northern division extends from Bundelcund and the Saugor district, and has an area of about 19,505 square miles; its population is about 1,180,000 souls, and its public revenue about Rupees 67,65,000. The 3rd or south-west division goes on, westward, to the Bombay Presidency, and contains the remainder of Gwalior, Holkar's states, Bhopal, Dhar and Dewas and other small states. The area of this division is about 41,700 square miles, its population about 3,320,000 souls and its public revenues about Rs. 1,30,00,000. The states and petty chiefships in Central India, form a political and are in a natural division of British India, and include an area of 83,600 square miles and a population of 7,670,000. This territory is divided amongst 71 native states, viz :—

	Principal states.	Secondary.	Minor and Petty.	Total.
Mahratta ...	2	2	—	
Mahomedan..	1	2	4	
Bundela ..	—	6	11	
Rajput ..	1	12	20	
Brahmins &c.	—	1	3	
	4	23	44	71

with a total revenue of rupees 2,61,23,000. Rewah is almost unknown to Europeans. It possesses great mineral wealth. Its plains are fertile but the valley of the Soane to the south of the Kymore range, desolate. The people of Rewah are described as indolent and untrustworthy; and they, and the country generally, are certainly far less civilized than the neighbouring state and people of Bundelcund. Though widely different in other respects, there is one characteristic common to the Baghel of Rewah, the Boondela of Bundelcund, and the Rajpoot of Gwalior and Malwa,—a dislike to labour or service away from their homes, so that they do not generally take an active part in the business of tilling the soil, such being, as a rule, left to the inferior and servile classes. They are throughout the territory generally regarded as the local heads of society or of the village communities to which they belong, and many of them possess much influence amongst those around them as the representative of the ancient families of the respective clans, but the condition of the Rajpoots in the States of Central India is most miserable and pitiable. The numerous settlements mediated under Sir J. Malcolm's authority, were principally on behalf of the hereditary claims of the heads of these classes, who having been dispossessed of their estates, and in many instances driven to the jungles, were at that period (under the designation of "Grassiah"

and "Londiah") the local, as the Pindaree were the general, pests of the country, their whole subsistence being obtained by violence and marauding. In Bundelcund and Rewah—differing in this respect from Central India, there is no decadence among the clansmen, the old families still hold the land. Their armies are,

Trade is chiefly carried on in Malwa and at Gwalior. In Malwa the principal marts are Indore, Bhopal, Oojein, Mundissore, Rutlan, Dhar, Jowra, Augur, Neemuch, Shoojawulpoor, and Bhilsa. Opium chiefly is sold in Rewa, its chief is of the Baghel race. The rajah Rama, Baghel, protected Hamayun's wife, mother of the emperor Akbar. The Baghel are of the Solunki rajput race. The four Agnikula or fire-born rajput tribes, the Chohan, Solunki, Powar or Prumar, and the Purihar, are now mainly found in the tract from Ujain to Rewah near Benares. The unnamed progenitors of these races seem to have been invaders who sided with the brahmins in their warfares, partly with the old Khetri, partly with increasing schismatics and partly with Græco-Bactrians, and whose warlike merit as well as timely aid and subsequent conformity, got them enrolled as "fireborn," in contradistinction to the solar and lunar families. The Agnikula are now mainly found in the tract of country extending from Oojein to Rewah near Benares, and Mount Aboo is asserted to be the place of their miraculous birth or appearance. Vikramajet, the champion of brahminism, according to common accounts, was a Powar Rajpoot.—*Capt. Cunningham's History of the Sikhs*, p. 12. *Ann. Ind. Adm. Vol. XI*, pp. 312, 343.

RHABARBER. GER. Rhubarb.

RHACOPHORUS, the Flying frog of Borneo, a species of *Rhacophorus*, has very long and fully webbed toes, which it spreads out when leaping. It is a tree frog, and by spreading out its membrane can descend from very high trees to the ground.—*Wallace*.

RHADIKA, also Rhadia, mistress of Krishna.

RHADOONI. BENG. *Apium involucreatum*.—*Roxb.*

RHAGÆ See Arians..

RHAGES, founded by Ismael, the Samanian, in A. D. 906, conquered in 1037 by Mahmud. See Rhe.

RHAIRA GARH. The most important of the Chhattisgarh feudatory states. It consists of four pergunnahs or sub-divisions, with 585 villages, mostly lying in the richest part of the Chhattisgarh plain.

RHAMNACEÆ. *Lindl.* The Buckthorn tribe of plants comprising 10 gen. 28 sp. viz, 14 *Zizyphus*; 1 *Berchemia*; 2 *Sageretia*; 1 *Ventilago*; 2 *Rhamnus*; 1 *Scutia*; 1 *Hovenia*; 3 *Colubrina*; 1 *Vitmannia*; 2 *Gouania*.

RHAMNUS, a genus of plants of the natural order Rhamnaceæ, of which several species grow in the Himalaya and China. In Europe the juices of the unripe fruits of *Rhamnus infectorius*, *catharticus* and *virgatus*, known as Turkey or French berries, are used for dyeing leather yellow. When mixed with lime and evaporated to dryness, it forms the color called sap-green. *M. Rondot's* book entitled *Notice du Vert de Chine*, contains specimens of calico and silk dyed with 'green,' and engravings of two plants, *Rhamnus utilis* and *Rhamnus chlorophorus*, from which it is derived. These plants were new to European cultivators; they are, however, allies of the *Rhamnus theezeans* which has long been known as a tree from which the poorest class of Chinese pluck the leaves to use as a substitute for tea. The color of the dyed silk is remarkably bright, a blue green, one of that class of colors

which increase in brilliance in the light. It contains, in fact, some immediate principle which can only be developed by light, and it was a nice task for chemists to discover what this is. *M. Persoz* says that light will have to be more and more regarded as an industrial agent; and of the Chinese green he remarks that it is *sui generis*, containing neither yellow nor blue. By experiments made at Lyons, it appears that six species of the European *Rhamnus* will yield a green dye. Fortune, says of the "green indigo," that a portion of cotton cloth obtained in China by the French manufacturers being greatly admired on account of the peculiar green of its dye, was submitted to the celebrated chemist, *M. Persoz*, with a request that he would endeavour to ascertain the composition of the green color. The following is a summary of his report upon this subject to the Academy of Sciences. Every attempt that I made upon the specimen to detect evidence of the presence of a blue or yellow failed, and I was led to the conviction, by isolating the coloring principle, that the green was produced by a dyeing material of a peculiar nature and *sui generis*. It further was evident.

That the coloring matter was an organic product of vegetable origin.

That the fabric on which it was fixed was charged with a strong dose of alum and a little oxide of iron and lime, bodies, the presence of which necessarily implied that mordants had been used in dyeing the calico.

These results were so positive, and at the same time so opposed not only to everything known in Europe regarding the composition of green color, but also to all that is recorded by writers regarding the dyeing processes employed in China for the production of green, that I was induced to go into a more detailed investigation of the subject; and about the end of last November I applied to Mr. Forbes, the American Consul at Canton, for some of this valuable material. I am indebted to his kindness for a specimen weighing about one gramme (15½ grains). The substance is met with in thin plates of a blue color, having a strong analogy with that of Java indigo, but of a finer cake and differing besides from indigo both in its composition and in all its chemical properties. On infusing a small fragment of the substance in water, the liquid speedily became colored of a deep blue with a shade of green. After the temperature had been raised to the boiling point, a piece of calico, prepared for printing with mordants of alum and oxide of iron, was dipped in it and a true dye was the result. The following appearances were observed. The portion of the fabric to which alum had been applied showed a deep green, of more or less intensity, accord-

ing to the strength of the mordant. The portions charged with both alum and oxide of iron yielded a deep green, with a shade of olive. The portions charged with oxide of iron alone yielded a deep olive. The parts of the cloth where no mordant had been applied remained sensibly paler. The colors thus obtained were treated with all the re-agents to which the Chinese calico had in the first instance been subjected, and they behaved in precisely the same manner. From these experiments it may be inferred,

That the Chinese possess a dye-stuff presenting the physical aspect of indigo, which dyes green with mordants of alum and iron.

That this dye stuff contains neither indigo nor any thing derived from that dyeing principle.

Mons. Legentil, President of the Chamber of Commerce of Paris, having perceived the importance of France being speedily put in possession of this valuable material, with a view to the interests of science and of industry, took the necessary steps for procuring a suitable quantity with the least possible delay, and at the same time to have inquiries made as to its origin and mode of preparation. Mr. Fortune adds, that the flowers of the *Whi-mei* (*Sophora japonica*) were sent home as of the "green indigo," but this plant yields a yellow dye and even when mixed with blue to make a green, the green is not that kind noticed by the French manufacturers. At another place, he says, here I found fields under cultivation with a kind of *Rhamnus* apparently. The Chinese farmer called it "Loh-zah, or "Soh-loh-shoeo" and showed me samples of the cloth which had been dyed with it. To my delight these samples corresponded exactly with those sent back from France, one of which was in my possession, but he told me that two kinds were necessary—namely the variety they cultivated in their fields and one which grew wild on the hills—in order to produce the dye in question. The former they called the yellow kind and the latter the white kind. The dye itself was not extracted by them, they were merely the growers, and therefore I could get no information as to its manufacture. I however secured a good supply of plants and seeds of both kinds, which were afterwards sent to India and England. My further inquiries on the subject of the manufacture of the "green indigo" were conducted in connection with Dr. Lockhart and the Rev. J. Edkins, of Shanghai. We found that a considerable portion of this dye was made near a city called Kia-hing-foo, situated a few miles west from Shanghai, and Mr. Edkins procured a bundle of chips there which exhibited the state in which the article

is sold in the market. Since I left China I have received the following interesting letter from Dr. Lockhart, which throws much light on the subject. The information was procured by Mr. Edkins and may therefore be fully relied upon. "The bark of two kinds of the tree known as the 'green shrub' (*Luk-char*), one wild, which is called the white, and another cultivated, which is called the yellow, are used to obtain the dye. The white bark tree grows abundantly in the neighbourhoods of Kea-hing and Ningpo; the yellow is produced at Tsah-kou-pang, where the dye is manufactured. This place is two or three miles west from Wang-steen, a market-town situated a little to the south of Kea-hing. The two kinds are placed together in iron pans and thoroughly boiled. The residuum is left undisturbed for three days, after which it is placed in larger earthenware vessels, and cotton cloth, prepared with lime, is dyed with it several times. After five or six immersions the coloring matter is washed from the cloth with water and placed in iron pans to be again boiled. It is then taken upon cotton yarn several times in succession and when absorbed in this way it is next washed off and sprinkled on thin paper. When half dry the paper is pasted on light screens and strongly exposed to the sun. The product is called *Luk-kaon*. In dyeing cotton cloth with it ten parts are mixed with three parts of sub-carbonate of potash in boiling water. The dye made at Tsah-kou-pang is not used to dye silk fabrics, because it is only a rough surface which takes it readily. To color silk with it so much of the material must be used that it will not pay. All cotton fabrics, also grass cloths, take the color readily. The dye does not fade with washing, which gives it a superiority over other greens. It is sent from Kea-hing as far as Shan-ting. It is also made in the province of Hoonan and at Ningpo, but the dye at these places is said to be of an inferior quality. It has long been used by painters in water-colors, but the application of it to dye cloth was first made only about A. D. 1825. If some method could be discovered of applying it to silk fabrics it would become still more useful. The above information obtained by Mr. Edkins on this subject is, no doubt, perfectly correct. It agrees, says Mr. Fortune, in the most important particulars with what I had gleaned from time to time amongst the Chinese in various parts of the country. The chips he brought with him from Keahing were identical with the 'Soh-loh,' or 'Loh-zah,' (*Rhamnus* sp.) which I have already mentioned, and his statement that two varieties of the plant are used to produce the dye agrees with my own obser-

variations. The mode of extracting the dye from the bark or wood, for both seem to be used, as practised by the Chinese, appears to be slow and tedious but with our superior knowledge of chemistry this might possibly be improved. From these investigations it would appear that two coloring principles are necessary to the production of this dye. This however, will not effect the value of it as a rich and permanent green, a quality which has been appreciated by the French manufacturers, and which is also well known to the Chinese. At another place he mentions that the Rhamnus producing the (so called) green indigo has been discovered and introduced both to England and to India. The Revd. Dr. Smith also tells us that the bark of a species of Rhamnus, brought from Cheh-kiang, is used in that province (Hang-chan-fu) in the manufacture of a beautiful green dye. It is called Luh-t'san by Dr. Williams and is probably the Rhamnus infectorius of botanical works. From one of this genus, the Rhamnus catharticus of Europe, the pigment called Sap green or Bladder-green is obtained. Voigt gives Rhamnus incanus and R. virgatus as plants of India.—*Fortune's Res. among the Chinese*, pp. 146 and 167. *Smith's Chinese Materia Medica*, page 44. *M. Persoz, on the green dye of China*.

RHE or **RHEI**. The ruins of the ancient city of Rhe, the Rhages of the Apocrypha, are a few miles south of the city of Teheran. They cover a vast extent of ground, and have supplied materials for the modern capital of Persia. The scriptural accounts of Rhe, Rhei or Rhages, during the captivity of the Jews in this part of the Babylonian empire, fully proves that Rhei was a very considerable city, at least two hundred years before their deliverance.—*Porter's Travels*, Vol. I. p. 357. —*Markham's Embassy*, p. 99. See Rhages.

RHEBARI. See Rajpoots.

RHEEA of Assam, is the Boehmeria nivea, from which the China grass fibre is obtained, and is called in China, Chu-ma or Tchou-ma. The preparation of the fibre is tedious, and is what causes the difficulty of sending the fibre at a cheaper rate into market. Major Hannay writes, "when the stalks have become brown, for about six inches above the roots, the top is seized with the left-hand and the leaves are stripped off by passing the right-hand to the ground, near which the stalk is cut. The outer bark has first to be scraped off with a blunt-edged knife, when the exposed fibres still attached to the woody part of the stalk is exposed to the hot sun to dry. On the third morning, after being exposed to the dew for several hours, the fibre is drawn off. This is done by breaking the woody stalk right through towards the

thicker end, and then separating the fibre therefrom, drawing it off slowly towards the small end, and repeating the process as often as necessary, though much of the fibre remains and may be taken off at a second breaking. The fibres now require to be carefully washed. The hanks of fibre are then separately twisted at the upper end and tied up in bundles. When the threads are required for spinning, they are prepared by drawing the single hanks several times with a blunt-edged slip of bamboo held in the right hand, when they are easily opened out to the required fineness with the fingers and thumb-nails. Dr. MacGowan, of Ningpo, states that in China the last cutting is made in September, from which the finest cloth is made, the first being inferior, coarse and hard. On being cut, the leaves are carefully taken off on the spot; the stocks taken to the house and soaked in water for an hour. In cold weather the water should be tepid. After this the plant is broken in the middle, by which the fibrous portion is loosened and raised from the stalk. Into the interstice thus made, the operator thrusts the finger nails and separates the fibre from the centre to one extremity and then to the other. The stripping process is very easy. The next process is scraping the hemp, to facilitate which the fibre is first soaked in water. The strips of hemp are drawn over the blade of a small knife or scraper from within outwards, and being pressed upon by the thumb, the fibrous portion of one surface, and the mucilaginous part of the other are thus taken off. The hemp is then wiped dry and the whitest selected for fine cloth. It is afterwards bleached.

The following directions for peeling the Chu-ma or Tchou-ma in China, are translated from the Chinese. When the stems are all got in, they are split longitudinally with knives of iron or of bamboo. The bark is first removed, then the lower layer (which is white and covered with a shrivelled pellicle which comes off by itself) is scraped off with a knife. The interior fibres are then seen; they are to be removed and softened in boiling water. If the Tchou-ma be peeled in winter, the stems must be previously steeped in tepid water, in order that they may be the more easily split. The first layer of Tchou-ma is coarse and hard, and is only good for making common materials; the second is a little more supple and fine; the third, which is the best, is used for making extremely fine light articles.

Ban Rhea, or *Bun Rhea*, or *Bon rhea*, is the Jungle Rhea, of the Lepchah of Nepal, and is supposed by some to be the Dom Rhea or

China Nettle in an uncultivated or wild state. But of this there is no proof, and it is more than probable that it is a distinct species of *Boehmeria*, possessed of many of the same properties as the Ramee or Rhea Nettle. It grows very common, in all the Assam province, but it is cultivated largely by the Hill tribes, on the west of Yunnan and to a small extent by the Singpoo and Dhoannca tribes, of the north eastern frontier of India, to be fabricated into a coarse cloth, but chiefly for nets. A five inch rope of Rhea fibre and one of Bon Rhea each broke within a few pounds of each other, after sustaining a weight of more than nine tons. It is reported to be all that can be desired for either canvas or lines, and only requires to be known to be generally used for that purpose. The Bon Rhea thrives best in the vicinity of water or of running streams; when unmolested it grows into a tree, but by proper management of it, any quantity of young shoots can be obtained, and as the divided roots of the plant afford numerous shoots it can be propagated by slips as well as by the seed. This fibre is about five feet in length, brown in colour, strong and flexible—*Royle's Fib. Plants. Dr. McGowan.*

RHEEDE, VAN, Governor of the Dutch possessions in Malabar: at his suggestion the *Hortus Malabaricus* was prepared in 12 Vols. folio. This botanical work was undertaken at the suggestion of Henry Von Rheede, a Dutch Governor of Malabar: the specimens were collected in 1674 and 1675 by brahmans, and sent to Cochin, where drawings of them were executed by Mathæus, a Carmelite and missionary; corresponding descriptions were at the same time made in the Malabar language, which were afterwards translated into Portuguese by Emanuel Carneiro, a Cochin interpreter, and from that in Latin by Hermann van Douep, the Secretary to the city of Cochin: the whole was under the superintendence of Casarius, a missionary there. The work was at length published at Amsterdam between 1686 and 1703, in 12 volumes folio with 794 plates, and was edited by Commelyn, who added occasional remarks on the plants. —*Wight's Prodromus Floræ, Vol. 1. p. vii. H. et Th. p. 45.*

RHEONJ. HIND. *Acacia rheonj.*

RIETSAMARAM. TEL. *Xanthoxylon rhesa, D. C.*

RHEUM, a genus of plants belonging to the natural order Polygonaceæ, of which several

species grow in the N. W. Himalaya, the roots of which known as rhubarb are valuable in medicine. One species grows in Kaghan, where it is known under the name of Chotial. *R. capsicum*, *Fischer*, is a plant of the Altai, *R. compactum*, *Linn*, grows in Tartary and China, *R. crassinervium*, *Fischer*, has heart-shaped leaves. *R. leucorrhizon*, *Pallas*, a plant of Tartary, is supposed to yield some of the best rhubarb of commerce, *R. palmatum*, *Linn*, grows near the great wall of China and in the Himalaya; *R. raphanicum*, *L.* grows north of the Caspian. *R. ribes*, is the Riwash of Persia; *R. spiciforme*, *Royle*, grows in Kunawar and in the N. W. Himalaya; *M. undulatum*, *Lam.* is a plant of China and Siberia. *R. Webbium*, *Royle*, grows at 12,000 feet on the Chur mountain. Dr. J. L. Stewart says that at least two species of rhubarb are frequent in parts of the Punjab Himalaya, from 6,200 to 14,000 feet, *R. Moorcroftianum* occurring still higher from 15,000 to 17,000 feet. The officinal ribas of the Punjab drug-sellers consists of the dried stalks from Kabul, which may partly be produced by the Ribas, or *R. ribes*, Gron, a native of Carmel, &c., Eastern Persia and the Hindu Kush. In Afghanistan the plant is always wild, and appears to grow abundantly in many parts. When green, the leaf stalks are rawish, and, when blanched by heaping up stones and gravel, round them, are called *chukri*; when fresh (in which state they are sometimes brought to Peshawar in spring), they are eaten either raw or cooked, and they are also dried for use to be eaten with other food, and are sometimes made into a preserve. The root is imported into Afghanistan and India to be used as a purgative. It is stated by Moorcroft that the Bhotia of Garhwal apply the powdered root to wounds and bruises, and that they use it with Rubia majistha, and potash for dyeing red. *R. emodi*, *Wall.* *R. Moorcroftianum* *Meisn*; *R. spiciforme*, *Royle*, all yield the officinal rhubarb root.—*Dr. J. L. Stewart, M. D. Royle's Ill. Him. Bot. Moorcroft's Travels.*

Rheum emodi, *Wall.*, is a plant of the N. W. Himalaya: it is less active as a purgative, and more spongy in texture. Honigberger mentions that *Rheum australe*, *Don*, *Rheum emodi*, *Wall.*, the common or small stalked rhubarb, vegetates in wild luxuriance on the Cashmerian mountains. It is considered as one of the best rhubarbs, notwithstanding the coarse appearance of its exterior: it can be had fresh and cheap in any quantity, and at any time.—*Thirty-five years in the East by Dr. Honigberger, p. 33. Cleghorn's Punjab Report. Kullu and Kangra, p. 81.*

RHEUM MOORCROFTIANUM. *Meisn.*
plant found by Moorcroft near the Niti pass in the Himalaya at an elevation of 12,000 feet.

RHIND, a great race dwelling in Beluchistan, the number of whose branches is forty-four. Though reckoned Balooch they are not of the Brahui stock, and their traditions allege that they immigrated ages ago from Damascus and Aleppo. Their language is the Jetki, in common with that of the other inhabitants of Cutch Gandava and mard-i-Rhind, means a brave man. The Rhind of Cutch Gandava are of the Utanzye division. Other Rhind tribes reside as under:

Utanzye, at Suran.	Sing Soloh at Teriki.
Dumbki, at Lehri.	Homorari, at Tambu.
Jakrani, at ..	Push, at Johan.
Doda Marri, at Kahan.	Jamali, at Rojan.
Mandarari, at Rodbar.	Kallui, at Lup.
Bugti, hills east of Leh-rat.	Kuchik, at Kirta.
	Pugh, at Kajuri.

The Bugti are on the west bank of the Indus near Shikarpore in the east of Lehri. Of these Rhind tribes, the Dumbki, Jakrani, Bugti and Doda Marri, have always been distinguished by their rebellious and predatory habits. The Murri tribe is considerable and inhabit the eastern portion of Kutch Gandava, and a peaceful and obedient portion of the tribe are in the hills west of the province below Jell. A large portion are at Adam-marri, on the S. E. Frontier of Sindh. The Marri of Kutch Gandava are notorious for their lawless habits. They and the Maghazzi seem to have emigrated from Mekran to Kutch Gandava, at different periods and to have become incorporated with the Jut cultivators. The Magazzi are probably of the same race as the Rhind. See Rind.

RHINOBATIS, a genus of fishes belonging to the family Squatinorajoidæ which comprises 3 *Pristis*; 2 *Rhinobatis*; 1 *Raja*; and 1 *Urogymnus*.

RHINOCEROS, a genus of mammals belonging to the Family Rhinocerotidæ, of which four or five species occur in Africa and three species in the East Indies, viz. *R. Indicus*, the great Indian Rhinoceros; *R. Sondaicus*, the lesser Indian Rhinoceros; and *R. sumatranus* of Assam, Sandoway and Sumatra. The Rhinoceros was in Sindh and the Punjab at least as late as Jordanus's time, and in Peshawur province two hundred years later. According to Captain Smith, the Rhinoceros uses its tusches like the boar, in attacking animals. These are the weapons it brings into deadly play and not the horn as many people believe. On one occasion he witnessed a Rhinoceros in Nepal destroy an elephant with its tusches. The rhinoceros has been found fossil in Ava, and Perim. Rhinoceros' hide is made into sword handles and ramrods, and its horn into goblets, and drinking cups. Mr. Blyth has identified the two-horned Rhinoceros of the Tenasserim provinces with *Rh. Crossii*, Gray, and he refers the species to *Rh. Sumatranus*, auctorum, which attains a development of horn hitherto unsuspected. The skull of a one-horned Rhinoceros shot by Dr. Hook near Tavoy Point, where there is a small isolated colony of the species, is that of *Rh. Indicus* and not *Rh. Sondaicus*; seemingly all the species of Rhinoceros attack the watch-fires of travellers. Fine horns of the Asiatic two-horned Rhinoceros are difficult to procure, as they are bought up at extravagant prices by the Chinese who call them Si-koh, and their skins Si-pi. The inhabitants of the forests of Chantaburi chase wild beasts with fire-arms and nets; but they attack the Rhinoceros armed with solid bamboos, of which one end has been hardened by exposure to the fire and sharpened; they invite the animal by loud cries and clapping their hands to meet them, which he is wont to do by rushing violently upon them, opening and closing his wide mouth; they attack him in front, and drive the bamboos violently into his throat with surprising dexterity, taking flight on all sides. The animal, in its agony, throws itself on the ground, and becoming exhausted by the effusion of blood and the extremity of its suffering, it soon becomes the prey of its courageous assailants. In their hunting expeditions, all the passages to a district are closed with nets, and fire being applied to the jungle, the wild animals are destroyed as they seek to escape.—*Jon Batuta*, iii. 100, *Baber*, pp. 292, 316. *Journ. Asiat. Soc. i. tom. ix. 201. Petis de la Croix, Timur*, p. 158, in *Yule, Cathay*, I. p. 194. *Mr. Blyth in Journal*

of the Asiatic Society of Bengal, p. 193-194. —*Bowring's Siam*, Vol. I. p. 26. *Gray P. Z. L.* 1854, p. 250. *Phil. Tran. LXXXIII.* (1793) tab. II. *Smith's Five Years in Nepaul. Smith's Chin. Mat. Med.*

RHINOCEROS INDICUS, Cuv. Blyth.

R. unicornis... .. *L. R. Asiaticus*, Blumenb.
R. inermis... .. *Lep.*

Genda, Gonda, Gor... .. ASSAM.
Ganda, Geura... .. HIND.

The great Indian rhinoceros or small horned rhinoceros, has one horn; it is found in the forest swamps and dense jungles at the foot of the Himalaya, in the Terai from Rohileund, in the Nepal Terai and Sikkim Terai from Bhutan to Nepal, but is most abundant in Assam and the Bhutan Dooar. Its length is from 9 to 12 feet and its height $4\frac{1}{2}$ to 5 feet, horn occasionally 2 feet.

RHINOCEROS SONDAICUS.—Sol. Muller, Blyth.

R. Javanicus. F. Cuv. | Lesser Indian Rhinoceros.
Warak... .. JAV. | *Badak*... .. MALAY.

This species has one horn and is 7 or 8 feet long, and $3\frac{1}{2}$ to $3\frac{3}{4}$ feet high. It inhabits the Bengal Sunderbuns in the forest tract along the Mahanuddy river, and extending northwards towards Midnapore and on the northern edge of the Rajmahal hills near the Ganges. It occurs also abundantly in Burmah and through the Malayan peninsula to Java and Borneo.

RHINOCEROS SUMATRANUS, Raffles.

R. Sumatrensis... Cuv.

The Sumatran rhinoceros is not confined to that island, but occurs in the Indo Chinese territories, in Assam and from Sandoway, in Lat. 23° N. to Sumatra. It has two horns. Dr. Oldham while with the embassy to Ava shot one which attacked his watch-fire.—*Blyth in Journ. Ben. As. Soc. Jerdon's Mammals*, pp. 223, 234, 235. *Horsfield*, p. 195. *Wallace's Archipelago*.

RHINOLOPHUS, a genus of bats of which several species occur, in the East Indies. Drs. Jerdon, Kelaart and Horsfield mention the following:

R. affinis var rubidus, Kelaart, Ceylon.
R. brevitaris, Blyth. Darjeeling.
R. fulvidus.
R. macrotis, Blyth. Nepal, Mussoori.
R. mitratus, Blyth. Central India, Mussoori.

RHINOLOPHUS FULVIDUS, var *rubidus*, Kelaart. Head and body of a deep orange red colour. Membrane pale brown. Inter-

femoral membrane enclosing the whole tail, and the free edge running almost in a straight line rounded off near the tail. Length of head and body $1\frac{1}{2}$ in.; tail $\frac{3}{4}$ in.; expanse 8 in. This beautiful bat is seen at Kadugavana at 2,000 feet, only for a few days in the month of August.

RHINOLOPHUS, n. s. ? Rufescent-brown; face slightly fulvous. Round the ear and on the sides of the posterior half of the body bright fulvous. Tail enclosed in the inter-femoral membrane. Head and body $2\frac{1}{2}$ in.; tail 1 in.; expanse 11 in. Only one dried specimen procured from Kadugavana, none seen since.

RHINOPOMAHARDWICKII.—Gray, *Blyth*.

The long tailed leaf bat is found over almost all India, in Burmah and Malaya in old ruins, caves and clefts of rocks.—*Jerdon's Mammals of India*. See Chiroptera Mammalia.

RHIO, a Dutch Settlement on the Eastern side of the Malay Peninsula, was obtained by them about the year 1817, from the king of Johore, for a payment of 4,000 guilders a month. Rhio Island, bordering the Straits of Rhio, is about 8 or 9 miles in circumference, and being separated from the mainland of Bintang by a very narrow channel appears to form part of it. The town of Rhio stands on its north-west point, and was formerly a port of great trade, and seems still to enjoy a considerable traffic by small vessels. It has a well built fort on a hill commanding the tower. Rhio was made a free port, with a view to encourage the natives of the Archipelago to visit it for the disposal of their produce, but the object proved an entire failure, since the native vessels from the eastward all pass it and proceed to Singapore, which is only forty miles distant. Exemption from port duties will not alone induce the natives to visit Rhio, enterprising merchants, in whom they can put confidence, being also required. The European population consists entirely of individuals in the employ of the Government, not a single European merchant being established there. The little trade enjoyed by the settlement is chiefly with Java, several native vessels arriving annually from that island, which bring rice for the supply of the inhabitants, gambier being taken in exchange. Rhio Strait, is formed on the east by the island of Bintang, and on the west by the chain of islands of which Battam, Gampang and Gollat are the chief, numerous small islets and shoals fronting the main shores on each side and very much contracting the navigable channel.

RHIPIDURA, one of the fly-catchers of India, the white fronted flycatcher, is *Rhipidura albofrontata*, in habits it resembles the broad-

tailed species, but the clearness of the white on its body and forehead suffice to distinguish it from the broad-tailed flycatcher, *Rhipidura fuscoventris* is plentiful in gardens and wooded localities. It is not shy, for its size, but is bold and fearless, and will attack birds much larger than itself. The song of the male consists of a few loud and pleasing notes, uttered while the little creature is dancing along the branch with tail and wings expanded like a fan.—*Adams*. See Birds.

RHIZOBOLACKÆ. See Caryocar.

RHIZOMYS SUMATRENSIS, Raffles, var. *cinereus*, *McClelland*.

RHIZOPHORACEÆ, *Lindl.* The Mangrove tribe of plants, consists of trees, rarely shrubs, natives of salt swamps and marshes of the tropics, where they root in the mud, forming dense, most unhealthy jungles down to the very edge of the ocean.—

The mangrove tribe comprises 5 Genera, 9 species, viz., 2 *Rhizophora*; 1 *Ceriops*, 1 *Kandelia*, 2 *Bruguiera*; 3 *Carallia*. The coasts of the Bay of Bengal and of the Indian Islands abound in the mangrove, which is found also at the mouths of the Indus. Its bark has been used for tanning purposes, for which it is probably more suitable than for cordage. The bark of *Kandelia Rheedii* from the mangrove swamps is used by the Tavoy women in dying red, but Mason thinks as a mordant. A species of Ceylon, called Kadol, by the Singhalese, is a leafy mangrove found in the western and northern provinces of Ceylon, chiefly near the mouths of the rivers. The wood weighs lbs. 65 to the cubic foot, and is used for common house building purposes. It is calculated to last 20 years. A dye is extracted from the bark, and used for colouring leather, nets, sails, &c. Another species *Hiri-koddol*, *SINGH*, is a mangrove which grows in the western and northern provinces of Ceylon, and is used for common house building purposes. A cubic foot weighs lbs. 49, and it is estimated to last 35 years. A dye is extracted from the bark.—*Royle's Fib. Fl. p. 301*.—*Mason*.—*Mr. Adrian Mendis Roxburgh, Fl. Ind. Voigt p. 40*.

RHIZOPHORA CANDEL. *Linn. Roxb.* Syn. of *Kandelia Rheedii*, *W. & A.*

RHIZOPHORA CASEOLARIS. *Linn.* Syn. of *Sonneratia acida*.

RHIZOPHORA CONJUGATA. *Linn.*

Rhizophora candelaria, *W. & A. ; Blume.*
Pyu *Burm.*

A small tree of Ceylon, Malabar, Tenasserim and Java. Fl. middle-sized, white, faintly scented.—*Thwaites*, p. 120. *Voigt*, p. 41.

RHIZOPHORA CORNICULATA. *Linn.* Syn. of *Ægiceras fragrans*.—*Kon*.

RHIZOPHORA DECANDRA. *Roxb.*
Syn. of *Ceripora roxburghianus*.—*Arn.*
RHIZOPHORA GYMNORHIZA.—*Rhede.*

Kayu-api-api... MALAY.
Handeh kakora, Delta of Ganges.

This tree grows to a considerable size where the spring-tides rise over it, as in the delta of the Ganges. The wood has a sulphurous smell, and burns with a vivid light. The pith of the wood, boiled in palm wine or with fish is used as food. Trunk generally dividing before it reaches the ground like a parcel of hop poles piled up in form of a cone; the seeds hang down from their apex proceeds the root. It attains a considerable magnitude in places over which the spring tides rise. The wood is of a yellowish colour, hard and durable; its chief use is for burning and for posts with which to construct the houses of the natives. It is used for fuel in the Archipelago. The seeds of *Rhizophora*, *gymnorhiza* and *R. Mangli*, salt-water living trees, germinate on the branches and after increasing to a considerable length, fall into the mud where they stick with their sharp point buried in the mud, and soon take root. The roots of these trees, springing from the trunk and lower branches form a complicated series of loops and arches from five to ten feet high making an incomparable breakwater. The bark and roots of both these species serve for tanning leather as a black dye.—*Hartwig's Tropical World*, p. 97.—*Crawford's Dictionary*. *Rohde's MS. S.*

RHIZOPHORA MANGLE. *Rhede.*

Pukandel... TEL. TAM. | Manggi Manggi. MALAY.
Oopoopoma... BENG. | Bhora, ... BENG.

The *Bhora* of the Delta of the Ganges, the common black mangrove, is abundant on the shores of the ocean, and within the delta of the Ganges, where it grows to a considerable size. It is procured in plenty at Arracan, Malabar and Singapore, also in the east, in the Indian Archipelago it is used in tanning. The wood is dark-red, hard, and durable, and the bark is used for tanning leather. This tree forms a striking feature in the physical geography of the archipelago as it does indeed of all tropical countries, for a belt of it as deep as the reach of the tide is always found wherever there is a shallow and muddy shore. The tree rises to the height of forty or fifty feet, and is invariably found in such situations constituting a dense, and almost impenetrable forest. Each tree stands in a cradle of its own roots from five to six feet high, bare at low water but at high water covered so as to give the appearance of trees growing in the sea. The Mangrove jungle is the favorite resort of musquitos and crocodiles, and affords a convenient and almost

inaccessible retreat to the pirate. The bark is used to dye chocolate color. This was one of the colors introduced by Dr. Bancroft, and for the exclusive use of which he obtained an Act of Parliament. The great length of the seed of this species gives, in a very short time a young tree, for if the apex from which the root issues is only stuck a little way into wet soil or mud, the leaves quickly unfold at the opposite end.—*Eng. Cyc.*—*Crawford*, p. 266. *Simmonds*.—*Rohde's MS. S.* *Wight's Icon. Roxb. Voigt*, p. 245—941.

RHIZOPHORA MUCRONATA, *Lam.*

Rh. mangle, *Linn. Roxb.*?

Kayu api api ?	„	Uppu-ponna.	„

Grows in Madagascar, Mauritius, Arabia, at Trincomalie, Calpeutyn, Negumbo and other parts of the Ceylon coast, along with *R. conjugata*,—also in Malabar, the Sunderbuns and Java. The wood is dark reddish, hard and durable. The flowers are large, white and sweet scented. Bark used for tanning.—*Roxb. Voigt*, p. 41. *Thur.* p. 120. *W. Ic.*

RHIZOSTOMA, one of the *Medusæ*, of the *Aculephæ*. *Physalia* is also one of the *Aculephæ*, its filaments touching the skin, impart a stinging pain. Sea water, in the deep, is of a deep violet blue. But often, in the ocean, are luminous parks or points of light; also a soft, liquid, general, and wide spread effulgence. Occasionally are moon shaped patches of steady light and instantaneous recurrent flashes, and a milky sea is often seen. There are many minute ocean creatures, *Entomostraca* and others, which are luminous at night. Often the globular *noctiluæ* are to be seen, they are 1-275 to 1-325 of an inch in diameter and *pyrosoma* are also supposed to be its causes. The cause of a milky sea is not known, but a bucket of water brought from one had small *Entomostraca*, *Megalopæ*, minute *Medusæ*, small *Porpitæ*, *Pteropods*, *Annelids*, and *Globigerinæ*, and all night the crustaceæ gave forth bright spots of luminous light. It is the small crustacea (*Entomostraca*) and small *Medusæ* (*Medusidæ*) which seem to exhibit the more prominent luminous properties, the larger *Medusæ* (*Lucernaridæ*) as *Aurelia*, *Pelagia*, *Rhizostoma*, &c., the *Physophoridæ*, the *Porpita* or *Velella* or the *Physalia*, or Portuguese man of war. The *Protozoa*, *Noctiluæ* however retain their luminosity so long as they retain organic contractility. In the majority of cases of luminous annelids, the light manifests itself in scintillations along the

course of the muscles alone and only during their contraction. With the glow worm or *Lampyrus*, there is neither combustion nor phosphorus, but the light is the product of a nervous apparatus and dependent on the will of the animal. *M. de Quatrefages*. *Kulliker* quoted by *Dr. Collingwood, Figuier*.

RHODA. Guz. HIND. Catgut.

RHODIA, an out-caste race in Ceylon, little numerous, forbidden to approach a temple, or any of the higher castes. According to one tradition, these scarcely civilized beings were hunters who, on the eve of a solemn occasion, failing to obtain game, &c., murdered a child and sent its dismembered body for the king; but another tradition is to the effect that this caste persisted in eating beef after its use as food had been prohibited. The native laws forbade a Rhodia to approach a temple of Buddha or the gods, to build houses, or to live in any abode enclosed within walls, and even to this day, their dwellings are mere sheds, nor even to cultivate the soil or possess land. They were forbidden to approach much less to touch or breathe upon a caste man, and all things they touch are unclean. The men wander about in parties or tribes seeking their precarious subsistence. Their women perform feats of leger-de-main, and tell fortunes, their want of chastity being proverbial. Their numbers do not exceed a thousand, and they are principally in the Kandyan province, at Saffragam, Dombera, Wallean, &c. Nominally buddhists they are also devil worshippers. Rodeya or Rodda, in Singhalese, literally means filth. In their social degradation, they resemble the Cagots and Caqueax, who from time immemorial, have been held in abhorrence in the valleys of the Pyrenees and the plains of Bretagne, Poitou and Guienne.—*Sirr, vol. ii. p. 215. Ceylon*.

RHODANTHE. This beautiful annual flowering plant is a native of the Swan river in Australia. It grows to a large size, and is covered with innumerable blossoms of rose and yellow colour; when grown from seed, the plants require to be continually shifted into larger pots and the blossom buds at first pinched off; the shifting may be repeated five or six times until the plants have acquired a shrubby character, when the flowers will all expand, and continue in succession for some time.—*Riddell*.

RHODODENDRON, a genus of plants belonging to the Ericaceæ, of which many species occur in the mountainous regions of the E. Indies, the better known, being *R. anthopogon*, *arboreum*; *campanulatum*; *punicum*; and *purpureum*. Perhaps the most gorgeous of the native plants of Borneo are the various species of *Rhododendron*,

which there assume a peculiar form, being found epiphytally upon the trunks of trees. A species known as Brah in the N. W. Himalaya bears a bright red flower. Its wood is soft, used for charcoal and in zemindar's buildings. *Dr. Wight* gives in his *Icones*, *Rhododendron arboreum*, *formosum*, *grande*, and *Griffithianum*. *Rhododendrons* are very numerous at Laghep, near Tumloong, and *Dr. Hooker* gathered, in two days, seeds of twenty-four kinds. These occurred in the following order in ascending,—

Commencing at 6,000 feet.

<i>dalhousiæ</i> ,	<i>camelliæflorum</i> ,	<i>arboreum</i> .
<i>vaccinioides</i> ,		
	Above 8,000 feet.	
<i>argenteum</i> ,	<i>campbelliæ</i> ,	<i>thomsoni</i> ,
<i>falconeri</i> ,	<i>edgeworthii</i> ,	<i>cinnabarium</i> .
<i>barbatum</i> ,	<i>niveum</i> ,	<i>glaucum</i> .
	Above 10,500 feet.	
<i>lanatum</i> ,	<i>campylocarpum</i> ,	<i>hodgsoni</i> ,
<i>virgatum</i> ,	<i>ciliatum</i> ,	<i>campanulatum</i> .
	Above 12,000 feet.	
<i>lepidotum</i> ,	<i>wightianum</i> ,	<i>setosum</i> .
<i>fulgens</i> ,	<i>anthropogon</i> ,	

No *rhododendron* grows at Churra, but several species occur a little further north. On the hill above Choongtam village, in Sikkim, *Dr. Hooker* gathered, at 5,000 to 6,000 feet, *Rhododendron arboreum* and *Dalhousiæ*, which do not generally grow at Darjeeling below 7,590 feet. *Dr. Hooker* collected here ten kinds of *rhododendron*, which, however, are not the social plants that they become at greater elevations. Still, in the delicacy and beauty of their flowers, four of them, perhaps, excel any other, they are *R. Aucklandi*, whose flowers are five inches and a half in diameter; *R. Maddeni*, *R. Dalhousiæ* and *R. Edgeworthii* all white flowered bushes, of which the two first rise to the height of small trees. In the Tonglo mountains, in Sikkim, the trees in order of prevalence were,—the scarlet *Rhododendron arboreum* and *barbatum*, the latter thirty to forty feet high as large bushy trees, both loaded with beautiful flowers and luxuriant foliage; *R. Falconeri*, in point of foliage, the most superb of all the Himalayan species, with trunks thirty feet high, and branches bearing at their ends only, leaves eighteen inches long: these are deep green above, and covered beneath with a rich brown down. Next in abundance to these were shrubs of *Skimmia*, *Laureola*, *Symplocos*, and *Hydrangea*, and there were still a few purple *magnolias*, very large *Pyri*, like mountain ash, and the common English yew, eighteen feet in circumference, the red bark of which is used in Nepal as a dye, and for staining the foreheads of brahmins.—*Dr. J. L. Stewart*, 133. *Voigt*, 333. *Lou's Sarawak*, p. 65. *Hooker's Him. Journ. Vol. I. p. 167. Vol. II. pages 25, 197, 282.*

RHODODENDRON ANTHROPOGON, Hooker, and *R. setosum*, are two dwarf species with strongly scented leaves which occur at an elevation of 12,000 feet, near Wallanchoon in East Nepal.—*Hooker, Vol. I. p. 220.*

Mandal Chenab	Triki : Gandere.Ts.	
Burans..... HIND.	INDUS.

Grows up to 8,000 feet in the Alpine Punjab, and has a very wide range in India. It has lanceolate leaves, acute silvery beneath, tapering to the base; peduncles and calyxes woolly; segments of corolla 2-lobed, with crenulating, curled margins, capsule 10-celled, tomentose. It is a native of the warmer parts of India, and is one of the most beautiful of all trees, but too delicate to bear the open air in England. It is very common all over the Neilgherry hills, either forming small clumps or dotted about. It grows 20 feet high, having a gnarled trunk and deep crimson flowers, in masses. A steep ascent in the Ryott valley in Sikkim, led through large trees of *Rhododendron arboreum*. The variety roseum, of *R. arboreum*, grows to the height of thirty and forty feet, in Sikkim, bears bright, red, sub-acid flowers, which are made into jelly, wood brown, soft, used for charcoal and in zemindars' buildings, tree gives posts 6 inch in diameter.—*Cleghorn's Punjab Report, Kullu and Kangra, Powell's Hand-book. Hooker's Him. Journ. Vol. I. p. 167. Vol. II. p. 190.*

RHODODENDRON ARGENTEUM. The white flowered rhododendron is found in Sikkim, at an elevation of 8,671 feet. It is a tree 30 feet high, having leaves very beautiful in the leaf buds, erect and silky. The flowers are 2 to 3 inches long, 2 to 2½ inches in diameter, always white.—*Eng. Cyc.*

RHODODENDRON AROMATICUM. Its leaves, called "talesfur" are highly fragrant and stimulating; they are brought from Cabul, *Royle's Illustrations, p. 259.—O'Shaughnessy, page 425.*

RHODODENDRON BARBATUM.—Royle.

A tree from 40 to 60 feet high, branched from the base. It is one of the most beautiful of the Himalayan species, and is readily distinguished by its having bristly petioles and numerous branches floriferous at their apices. Dr. Adams observes that as he toiled up the steep ascent above his previous night's encampment, it was a beautiful sight to behold the hill sides covered with the scarlet flowered *Rhododendron barbatum*, in full blossom.—*Dr. Adams' Naturalist in India. Eng. Cyc.*

RHODODENDRON CAMPANULATUM.

Is found in the Sulej valley between Rampur and Sungnam at an elevation of 10,000 to 14,000 feet. It vegetates on the Kashmir mountains; its leaves are official in Kashmiri and Lahore, where they are administered as errhine, to produce sneezing. The leaves are imported from Tibet and Kashmir, under the names Burg-i-tibbut and Hoolas-i-Kashmiri, and are used by the Kashmir natives as a snuff.—*Cleghorn's Punjab Report, p. 67. Dr. J. L. Stewart. O'Shaughnessy, p. 425. Thirty-five years in the East by Dr. Houig, p. 385.*

RHODODENDRON CINNABARINUM, is the "Kema Kechoong," of the Lepcha, Kema signifying Rhododendron: this species alone is said to be poisonous; and when used as fuel, it causes the face to swell and the eyes to inflame; of this Dr. Hooker observed several instances.—*Hooker.*

RHODODENDRON CAMPANULATUM, Bre or Kathof Tibet. Its bark is used for paper making in the jail at Dharmasalla, the plant is very abundant.—*Cleghorn's Punjab Report. Kullu and Kangra, p. 80.*

RHODODENDRON FALCONERI, is a white flowered species, never occurring at less than 10,000 feet above the level of the sea, is one of the most striking and distinct of the genus. It occurs in East Nepal, and in point of foliage, this is the most superb of all the Himalayan species, with trunks forty feet high, and branches bearing at their ends only with leaves nineteen inches long. There are deep green above and covered beneath with a rich brown down.—*Eng. Cyc. Hooker, Vol. I. p. 272.*

RHODODENDRON HODGSONI. Its foliage is of a beautiful bright green, with leaves sixteen inches long; its bark is as delicate as tissue paper and of a pale flesh colour.—*Hooker, Vol. I, p. 950.*

RHODODENDRON EFIDOTUM.

Alpine rhododendron. ENG.	Tsaluma.....	PUNJAB.
Talesfar.....	N. INDIA.	Tsuma of...BHOTAN.
Talsur.....	PUNJAB.

This is found in the Sulej valley between Rampur and Sungnam at an elevation of 10,000 to 14,000 feet. Leaves highly stimulant.—*Cleghorn's Punjab Report, p. 67.*

RHODODENDRON NIVALE. This, the most alpine rhododendron, spreads its small rigid branches close to the ground. It is the most alpine of woody plants, and was

found by Dr. Hooker, at an elevation of 17,000 feet.—*Hooker's Him. Jour. V. II. p. 135.*

RHODODENDRON PUNICEUM.

Kaephul... HIND.

A common tree on the lower ranges of the Himalaya: the bark, called Kaephul, is brought to Ajmere, from Delhi and Mirzapoor, and is used as a rubefacient and sternutatory. Dr. Irvine found Kaephul and pounded ginger, mixed, the best substance with which to rub cholera patients to promote reaction: one maund costs five rupees. The fresh flowers are pleasantly acid, and are eaten by the hill men to quench thirst during their ascent of the hills, the flowers are also made into a jelly.—*Irvine's Gen. Med. Top.*

RHODODENDRON WALLICHII, is a very distinct and handsome species, with lilac-coloured flowers. Its leaves are quite unlike any Indian species, and the flowers in colour and size resemble those of the much cultivated *R. Ponticum*.—*Eng. Cyc.*

RHODYMENIACEÆ, an order of Algæ, the best known species of which is the *Gracilaria spinosa*, the Agar Agar of the Chinese, which is largely collected both for culinary purposes and as a component part of one of the strongest Chinese glues. It has recently been imported into England, and is occasionally used instead of carrageen moss in making jellies and blancmange.—*Eng. Cyc.*

RHOMBUS, a genus of fishes, of the order Pleuronectidæ.

RHONDUR. See India.

RHOOSKEE, QU ? **RHOOSKEE**, a native salt obtained from the saline waters of the Loonar lake.

Rubarber	GER.	

The rhubarb of commerce is obtained from a wide extent of country, from Ladak, in L. 77½ E. to the Chinese province of Shensi, 29 degrees further east, and it receives distinguishing names according to the country from which it is imported. In the years 1846 to 1850, the imports into Britain ranged from 44 to 42 tons, and the re-exports from 64 to 99 tons priced per lb., from 6d. to 12s. 6d. Between 1826 and 1849 the imports ranged from 4 to 17 tons.

The *Turkey Rhubarb* of commerce, is called also Russian rhubarb, but in Russia is called Chinese rhubarb, it is imported into the frontier town of Kinchta, thence into Moscow

and St. Petersburg, whence it is distributed to the rest of Europe.

Bucharian Rhubarb makes its way to Vienna by Brody and Nischuy and is supposed to be the inferior sorts of Turkey rhubarb.

Chinese Rhubarb, called also East Indian rhubarb, is produced in the mountains of Kan-su, but comes into the market in the three forms of Dutch trimme^d or Batavian rhubarb; Half trimmed or Chinese Rhubarb; and Canton stick rhubarb.

Siberian Rhubarb, called also Siberian Rhapontic root, is supposed to be the product of *R. rhaponticum*.

Himalayan Rhubarb, is a product yielded by *R. Moorcroftianum*, *Royle*; also by *R. Webbianaum*, *Royle*, and *R. spiciferum*, *Royle*. A variety of rhubarb termed rawash, is more or less plentiful in all the hills from Kalat in Baluchistan to Kandahar, and again from that place to Kabul. Attention is only paid to its growth by the inhabitants of Lughman, who supply the bazaars of the city of Kabul. They surround the choicer plants with conical coverings of stones, so as to exclude light and air, and thereby produce that whiteness of stem so much prized. The unblanched plant is called chukri, and is also exposed to sale. It makes an excellent preserve, by being first saturated in a solution of lime and then boiled with shirar, or the inspissated juice of grapes, losing, however, in this case, its characteristic flavour. Rhubarb grows in abundance, and to a large size in Barmor, and the valley through which the Ravi and its tributaries flow before reaching Dalhousie. A smaller variety deemed by the natives to be superior in quality grows in the crevices of the gneiss rocks, forming the peaks above Dharmasala. The common dock *Rumex obtusifolius* is not so conspicuous in the waste places of a highland glen as is the official rhubarb on the bare rocks in the valley of Asrang. It extends 5 or 6 miles down the valley, and ascends the slope to 500 feet above the river's bed. Captain Houchen and the Lama of Asrang said that it is equally abundant in the adjoining valley of Dingering. As it is improbable from the nature of the country that the best rhubarb is confined within very narrow limits, it becomes interesting to ascertain how near it approaches the British territories in India in order to share in the trade or attempt the cultivation. The following are four Himalayan species;

<i>R. emodi</i> (<i>Wall</i>),	Pindree glacier, &c.
<i>R. Webbianaum</i> (<i>Royle</i>),	Ohoor mountain.
<i>R. spiciforme</i> (<i>Royle</i>),	Werang pass.
<i>R. Moorcroftianum</i> (<i>Royle</i>),	Niti pass.

The above four species yield part of the Himalayan rhubarb. The Pen-t's'au, a Chinese

RHUS ACUMINATA.

work on medicines, places rhubarb at the very head of poisonous plants, and, undoubtedly, Chinese rhubarb, in China, is a very poisonous drug, causing severe purging and some prostration. It grows in Kink-chau-fu in Hupeli; Sui-teh-chau in the N. E. of Shen-si; Lungshien in Kau-suh; Mau-chau and Ching-tu-fu in Sech-uen. *Smith's Mat. Med. V. II. p. 485.*

RHUS. Of this genus of plants some species are poisonous, as *R. venenata*, *perniciosa*, *radicans*, and *toxicodendron*; *R. suaveolens* and *aromatica*, exhale a pleasant odour; and some have acid berries as *R. coriaria*; *R. buckiamela*, and *Schinus molle*. *Rhus cotinus* or Red sumach, has wood, called young fustiek, which, as well as the berries, is astringent, and *R. coriaria*, known by the name of Sumach, is a powerful astringent, chiefly employed in tanning leather. The seed of *R. parviflora*, tuntereck, is frequently substituted in India for that of the sumach. *R. glabra* is considered a febrifuge. *Rhus vernix*, a Japanese tree, exudes a whitish resinous juice, which soon becomes black in the air. *R. succedanea* and *vernificera*, both common to the Himalaya and Japan, are said, in the latter, to yield a similar product. Species of other genera, as of *Schinus*, contain a resinous matter. A *Rhus*, the Coongillya maram, of the Tamils, grows in Coimbatore very nearly allied to Roxburgh's *R. Buckiamela*, but distinct. The qualities of the timber are unknown. The outer sap-wood is white, fine grained and heavy, apparently very good. Two species of *Rhus*, Tetri and Arkhar, HIND. are plants of Kaghan. There are several species in the E. Indies. viz.:

<i>R. semialata</i> , Murr.	<i>R. vernificera</i> , D'C
<i>R. Javanica</i> , L. (cult.)	<i>R. toxicodendron</i> , L.
<i>R. succedanea</i> , L.	<i>R. venenata</i> .
<i>R. sylvestris</i> , S. & Z.	<i>R. bucki-amela</i> .
<i>R. glabra</i>	<i>R. copallina</i> &c..

Hulashing... KASH. | Tetri... HIND.
Rashin... KANAWAR.

Grows in Kumaon, Shreenuggur and the peninsula of India; Dr. Gibson says, it is not found in the Bombay presidency.—*Voigt. Drs. Wight and Gibson.*

RHUS CORIARIA.

Tumtum ... AR.	Mutchlee H'sot. HIND.
Sumach ... ENG.	Tatri ... PAN.
Elm-leaved Sumach ..	Shumuk ... PERS.
Hide Sumach ..	Mahi ...

A native of Persia, Syria, Palestine, and the south of Europe, about 8 or 10 feet high, divided into numerous irregular branches. All parts of this plant have a styptic taste; to the abundance of tannic acid it owes its properties and value in the arts. The leaves are extensively used in England for tanning purposes. M. Tromsdorf found in the berries a large quantity of bisulphate of lime. Used by natives in cholera and indigestion.—*O'Shaughnessy, page 282. Powell's Hand-book, Vol. I. p. 339.*

RHUS COPALINA. Linn. See Gums.

RHUS COTINUS.—Linn.

A tree of Kaghan, Himalaya, Salt Range, from 2,300 to 6,000 feet, grows three feet in girth. Wood yellowish, resembles that of *Pistacia integerrima*, but small twigs used for baskets, leaves and bark in tanning.—*Cleghorn's Punjab Report. Dr. J. L. Stewart, Punjab Plants.*

RHUS DECIPIENS. Wight.

Fehunbive ... SINGH.	Kattu puvarasu maram... TAN.
----------------------	------------------------------

Grows in the central province of Ceylon and in the south of India. Dr. Wight says it yields a very fine, close-grained, light coloured wood, and, if procurable of good size, the wood must be of considerable value. In Ceylon, Mr. Mendis says a cubic foot of it weighs 68 lbs., and it is used there for buildings, lasting 50 years.—*Dr. Wight. Mr. Mendis. M. E. J. R.*

RHUS KAKRASINGHEE.—Royle.

Kakur ... HIND | .Kakra ... HIND.

Occurs in Kangra and in the outer ranges of the Himalaya, and valleys of the interior of Kumaon. The wood is handsome, yellowish brown, darkly veined, hard, heavy, fine grained, very durable, takes a good polish and is much esteemed for making into furniture. A

gall is raised on it, which is used as a yellow dye. The horn-like excrescences, called *Kakra-singhee*, formed probably in consequence of the deposition of the ova of some insect, have long constituted a famed article of Hindoo medicine; they are found in the Deyra Dhoon and every where in the hills, at moderate elevations. Dr. Royle refers the specimens contained in his collection, which are identical with the above, to *Rhus Kakra-singhee*, but it has been doubted whether these galls are produced by a species of *Rhus*, as they are nearly identical with those found on *Pistacia terebinthus*.—*Mr. Thompson, MS.S. Cat. Ex. 1862.*

RHUS MYSORENSIS. The chief representative of its tribe in the barren hills of the Mysore territory; a scrubby shrub fit only for firewood.—*Dr. Gibson.*

RHUS PARVIFLORA.—Roxb.

Sumach. ENG. | Toong. PUNJABI.
Kakur. PANJ. |

This is found in the Sutlej valley between Rampur and Sungnam at an elevation of 5,000 feet. Wood, hard and yellow. Both this and *R. acuminata*, yield beautiful wood, the native name "*Kakur Singhi*," is from the long curved excrescences. The fruit of this species is called *tantarik* and is used as medicine by the hindus. This is found in the Sutlej valley between Rampur and Sungnam, at 5,000 feet.—*Dr. J. L. Stewart, Punjab Plants. Oleghorn's Punjab Report on Kullu and Kangra, p. 64; 81.*

RHUS SEMIALATA.—?

Sumach. ENG. | Tung. PUNJABI.

A tree of the N. W. Himalaya. Not procurable in any quantity. Not so ornamental as other woods of this family. *Oleghorn's Punjab Report.*

RHUS SUCCEDANEA.—Linn.

Choklu; Halashi; CHENAB | Hala; Halai, Halashi
Nu-Ching. CHIN. | RAVI.
Titar; Tatri. JHELUM. | Kakriu; Kulashing. "

This tree appears to be found on most of the great rivers of the Punjab from 3,000 up to 8,000 feet. It does not grow to a great size, nor is its wood valued. The juice of its leaves it is stated blisters the skin. In Bombay, a varnish is said to be yielded by this species. Its seed yields, on being pressed, an oil which soon congeals to the consistence of tallow, and from which in Japan candles are prepared as also from the coagulated oil of the *Laurus camphora*, and *glaucia*, of the *Rhus vernix*, and the *Melia ezedarach*. For burning in lamps again, to light up their rooms in winter, the Japanese make use of several sorts

of oil, as for instance, that of the *Dryandra cordata*, &c. but especially and most commonly, the *Brassica orientalis*. On the other hand, they use in the kitchen the finer oil of *sesamum*, for frying fish, and dressing other dishes.

Rhus succedanea, is said by Simmonds and the Rev. Dr. Smith to furnish the Japan wax, a substance of medium consistence between bees' wax and the ordinary vegetable tallow. It is softer, more brittle and fatty than bees' wax, easily kneaded and melts between 40° and 42° C. It contains twice as much oxygen as bees' wax and has a different composition consisting of palmitic acid united with oxide of glycerile. It has been used in England as a substitute for wax and for hard neutral fat, and after conversion with the acid both for candles and night-lights. *Oleghorn's Punjab Report. Oliphant. Thunberg's Travels, Vol. IV. p. 93. Smith's Mat. Med.*

RHUS VENENATA, D. C. Poison Sumach, Swamp Sumach. is a native of North America and Japan. This plant is so exceedingly poisonous that it is said to affect some persons by merely smelling it. A touch will sometimes produce violent inflammation. It is a beautiful shrub, and well worthy of cultivation, but great care should be taken to prevent its being carelessly handled.

RHUS VERNICIA. It is from this species that the Japanese prepare their lacquer which is so fine as to resist the action of hot water.

RHUS VERNICIFERA, D. C.

Rhus juglandifolia.—*Wall.*
Varnish bearing Sumach. | Japan varnish tree.

The varnish tree of Japan is common in the Himalaya, in Kumaon, Nepaul and Gurhwal. Its leaves are very large and beautiful, rendering it one of the handsomest of shrubs. According to Thunberg, this is the plant which yields the celebrated Japan varnish.—*Royle's Ill. Him. Bot.*

RHUS VERNIX.—?

Rhus vernicia | Chinese Varnish Tree.
Orrosino-ki. JAB. |

When Mr. Fortune prepared to take up his residence in China, his attention was directed by the Calcutta Agricultural Society, to the Chinese varnish tree, *Rhus* species, the wax insect tree, *Fraxinus* species, to the soap bean tree, *Cassalpinia* species, and to the various trees valuable for their fruit or timber and ornamental plants: but above all to the green indigo (so called), *Rhamnus* species, which yielded a dye that was at that time attracting much attention in France. He says, the tree which yields the Chinese varnish is a species of *Rhus* which although producing an article of great value, largely used in the country for giving a fine polish

to tables and chairs used in the houses of the wealthy, yet is extremely dangerous to use. The beautiful lacquerware so extensively exported from Canton to foreign countries, and which is so well known and justly admired, is produced by the varnish from this tree. It has the valuable property of being less liable than French polish to be injured by a heated vessel which may be placed upon it, but it is very poisonous and requires to be handled with great care by the workmen who use it. Indeed, even after furniture is dry it is very unsafe for certain constitutions until it has been in use for some time and the smell entirely gone. Mr. Jones, American consul at Foochow-foo, used some furniture which had been lacquered some time and was apparently quite dry and yet he was very ill for a long time from its effects, so ill that he thought he should be obliged to leave the country and go home, and Mr. Fortune had known several persons suffer most severely from the same cause.—Williams says, the beautiful appearance of the lacquerware of China owes its lustrous coloring to a composition of lamp black, and the clarified juice obtained from a species of sumach, called *Rhus vernix* or *R. vernicia*. Wood-oils are obtained from other plants of the same family, and the different qualities of lacquer ware are owing to the use of these inferior ingredients. The real varnish tree is described by De Guignes as resembling the ash in its foliage and bark, it is about fifteen feet in height, and furnishes the sap when seven years old, which is carefully collected from incisions in the trunk opened in the summer nights. The body of the ware is wood partially smoothed, or pasteboard, upon which two or three coats of a composition of lime, paper and gum are first laid and thoroughly dried and rubbed. The surface of the wood is also hardened by rubbing coarse clay upon it, and afterwards scraping it off when dry. Two coatings of lamp black and wood oil, or in the finer articles, of lamp black and varnish, are laid upon the prepared wood, and after drying, the clear varnish is brushed on, one coating after another, with the utmost care, in close and darkened rooms, allowing it to dry well between the several coats. The articles are then laid by to be painted and gilded according to the fancy of customers, after which a last coating is given them. The varnish is brought to market in brownish cakes, and reduced to its proper fluidity by boiling; it is applied to many purposes of both a varnish and paint, when it is commonly mixed with a red or brown colour. A beautiful fabric of lacquered-ware is made by inlaying the naere of fresh and saltwater-shells in a rough mosaic of flowers, animals, &c. into the composition, and then varnishing it. Another

kind, highly prized by the Chinese, is made by covering the wood with a coating of red varnish three or four lines in thickness, and then carving figures upon it in relief. The great labor necessary to produce this ware renders it expensive. A common substitute for the true varnish is the oils of the *Dryandra*, *Jatropha*, *Croton*, and other members of Euphorbiaceous family, expressed from their seeds by a variety of simple machines, consisting for the most part of different applications of power to cylinders and pestles by which the seeds are pressed or pounded. According to De Guignes the oil after pressing is boiled with Spanish white in the proportion of one ounce to half a pound of oil; as it begins to thicken, it is taken off and poured into close vessels. It dissolves in turpentine, and is used as a varnish, either clear or mixed with different colors; it defends wood work from injury for a long time, and forms a good painter's oil. Boiled with iron rust, it forms a reddish brown varnish. In order to prevent its penetrating into the wood when used clear, and to increase the lustre, a priming of lime and hog's blood simmered together into a paste is previously laid on.

Thunberg likewise says that this plant is said to yield the varnish used in Japan to lacquer. It is said to be procured from incisions made on stems that are three years old, from which it oozes like the milk of the India Rubber tree. It is tinted in a great variety of colours with colouring matter, which is rubbed into it on a copper plate, it is then laid on in successive coats and heavily embossed in gold or silver. The most common designs are the three emblems of longevity, the tortoise, the stork and the pine tree. The Varnish-tree, the Camphor-tree (*Laurus camphora*), the Pine (*Pinus sylvestris*), the Tea-tree (*Thea bohea*), the Cedar (*Cupressus japonica*), and the Bamboo cane, or reed (*Arundo bambos*), do not only grow wild in every part of the country, but are likewise cultivated in several places. The varnish-tree, he says, contains a milky juice, which is the best of all gums for lacquering. The camphor-tree grows wild in great abundance in the neighbourhood of Satsuma, and and on the Gotbo islands. From this tree was prepared the chief part of the camphor that was used in Europe. The Japanese split the wood and roots into very fine pieces, boil it up with water in an iron pot, covered with a wooden lid, which has a deep concavity on the inside. In this concavity they fasten a piece of straw or hay, so that the camphor, when it rises, may adhere to it. The gum camphor, on being separated from the straw, is in grains, and was packed up in wooden casks, and sold to the Dutch Company by weight.—Thun-

RIBBON ISINGLASS. See Gelatine.

RIBEIRO or Ribeyro, Author of a History of Ceylon, which he presented to the king of Portugal in 1695. Abbe Le Grand prepared from it, and in 1685 published a French version. The work was first published in Portuguese in 1836.—*Tennant.*

RIBES, a genus of plants belonging to the Natural order Grossulariæ, including the gooseberry, the currants. The species known in the East Indies are

R. glaciale. *R. nubicola.*
R. grossularia, L. *R. rubrum.*
R. leptostachyum, Dne.

Dr. Cleghorn mentions two species of Kaghan under the native names of Gwal-dakh and Gul-dagh. *R. nubicola*, *R. glacialis* and *R. grossularia*, the currant and gooseberry, grow in N.W. Himalaya at 11,000 and 10,000 feet; but the fruit is tasteless. Dr. Cleghorn also mentions a small, sour woolly gooseberry, called "bilitsi" in Lahaul. To these species belong the "gwal-dakh," or gooseberry of Kaghan, and the "rasta" or currant of Lahaul. *R. Leptostachyum, Dne*, the yellow currant, and *R. nigrum*, the black currant, are not uncommon from 7,000 to 14,000 feet in the Himalaya, and the former at least grows in Tibet and was found by Dr. Bellew at about 10,000 feet near the Sufed Koh. The fruit of the latter is very like the cultivated black currant, and very fair eating. *Ribes nigrum* is used in preparing the liquor called ratafia.—*Faulkner. Powell's Hand-book. Cleghorn's Punjab Report, p. 65. Dr. J. L. Stewart, M. D. Punjab Plants.*

RIBES GLACIALE.—*Wall.* This currant is found in the Sutlej valley between Rampur and Sunnam at an elevation of 11,000 feet. Several varieties occur but the fruits are without flavour.—*Dr. Hugh Cleghorn's Punjab Report, p. 65.*

This is one of the most extensively diffused and useful of grain crops, and supports a great number of the human race. Its cultivation prevails in all the river valleys and on all the coasts of eastern and southern Asia: it is a common article of subsistence in various countries bordering on the Mediterranean: it is grown in the Japan Islands, on all the sea coasts of China, the Philippine and other large Islands of the Indian Archipelago, in Ceylon, Siam, India, on both shores of the Red Sea, in Egypt, on the shores of the Mozambique Channel, in Madagascar, in some parts of Western Africa, South Carolina, and Central America. Three species only are enumerated by Lindley.—*Oryza sativa*, the common rice, a native of the East: *O. latifolia*, a species having its habitat in South America; and *O. Nepalensis*, common in Nepal. But there are a host of varieties known in the East Indies; which, however, may for all practical purposes, be resolved into two kinds—the upland or mountain rice (*O. Nepalensis*, the *O. mutica*, of Roxburgh), and the low land or aquatic species *O. sativa*, Linn. It is always substituted by the physician, when practicable, as the food best adapted to the laborer, in season of diarrhoea and other similar diseases, is preferred before any other grain by the negro; and if the clean rice be ground and bolted, a meal is produced which can be made up into various forms of cake and other bread, of unrivalled sweetness and delicacy.

Rice possesses the advantage attending wheat, maize, and other grains, of preserving plenty during the fluctuations of trade, and is also susceptible of cultivation on land too low and moist for the production of most other useful plants. Although cultivated principal-

ly within the tropics, it flourishes well beyond, producing even heavier and better filled grain. The chief variety of this cereal is cultivated throughout the torrid zone, wherever there is a plentiful supply of water, and it will mature, under favorable circumstances, in the Old World, as high as the 45th parallel of north latitude, and as far south as the 38th. Also, on the Atlantic side of the Western continent, it will flourish as far north as latitude 38 degrees, and to a corresponding parallel south. On the Western coast of America, it will grow so far north as 40 or more degrees. Its general culture is principally confined to the sea coasts and river valleys of India, China, Japan, Ceylon, Madagascar, Eastern Africa, the south of Europe, the Southern portions of the United States, the Spanish Main, Brazil, and the valley of Parana and Uruguay. At the Industrial Exhibition in London, in 1851, there were displayed many curious specimens and varieties of rice, grown without irrigation, at elevations of three thousand to six thousand feet on the Himalaya, where the dampness of the summer months compensates for the want of artificial moisture. At the exhibition of 1851, American rice received honorable mention for its very superior quality, and the Carolina rice was pronounced by the jury "magnificent in size, color, and clearness," and was awarded a prize medal. The jury also admitted that the American rice, though originally imported from the Old World, is now much the finest in quality. This has, however, long been known and during the years 1840 to 1870, the Governments of India introduced several of the American varieties into the Madras Presidency and several of the Himalaya rices into Lower Bengal and Oudh.

Rice being an aquatic plant, is best grown in low moist lands, that are easily inundated. The ground is ploughed superficially, and divided into squares of from twenty to thirty yards in the sides, separated from each other by dykes of earth one to two feet in height, and sufficiently broad for a man to walk upon. These dykes are for retaining the water when it is required, and to permit of its being drawn off when the inundation is no longer necessary. The ground being prepared, the water is let on, and kept at a certain height in the several compartments of the rice field, and the seedsman goes to work. The rice that is to be used as seed must have been kept in the husk; it is first put into a sack, which is immersed in water until the grain swells and shows signs of germination; the seedsman, walking through the inundated field, scatters the seed with his hand, as usual; the rice immediately sinks to the bottom, and many even penetrate to a certain depth in the mud.

Rice culture in the States of America dates from the latter end of the 17th or beginning of the 18th century. The quality of American rice is of two kinds—the red and the white, from the colour of the pellicle which encloses the seed, on the removal of which both are alike white. The former was accidentally introduced by a ship captain from Madagascar, and the latter was transmitted to America by a Mr. Doubois, treasurer of those days to the E. I. Company; the former is considered the better, and so kindly did it take to the soil, and so much was it then, and ever since, thought of, that the captain aforesaid was presented with a handsome gratuity. The cultivation is carried on in South Carolina in the marshy flats which are periodically covered by the floodings of the rivers, and for such culture that State possesses peculiar advantages which not only enable the cultivator to produce his grain at a trifling cost of labor, but also of a much finer quality than in those lands which are artificially irrigated. Carolina rice has a finer, handsomer grain than that which is grown in the country of its original production. The growth of rice in North America is almost wholly confined to two States nine-tenths of the whole product, indeed, being raised in the States of Carolina and Georgia; a little is grown in North Carolina, Florida, Alabama, Texas, Louisiana, and Mississippi. The aggregate crop, for 1843, amounted to 89,879,185 lbs., while in 1847 it had risen to 108,000,000 lbs. The largest rice crop grown in South Carolina for thirty years, was in 1847 when 192,462 tierces were raised; 140,000 to 150,000 is about the average, and it has only exceeded 170,000 on four occasions. The American crop of rice in 1848, reached 162,058 tierces in market, and of these 160,330 tierces were exported from South Carolina. The yield per acre, varies in S. Carolina from twenty to sixty bushels, weighing from forty-five to forty-eight pounds when cleaned. Under favorable circumstances as many as ninety bushels to an acre have been raised. A variety is cultivated in America to a limited extent, called Cochin-China, dry, or mountain rice, from its adaptation to a dry soil without irrigation. It will grow several degrees further north or south than the Carolina rice, and has been cultivated with success in the Northern provinces of Hungary, China, Westphalia, Virginia and Maryland; but the yield is much less than that already stated, being only fifteen to twenty bushels to an acre. It was first introduced into Charleston, from Canton, by John Brodly Blake, in 1772. The rice grown about New Orleans is as sweet, if not sweeter, than that of South Carolina, but it is deficient in hardness and brightness when

ready for market. Rice in Carolina is sowed as soon as it conveniently can be after the vernal equinox, from which period until the middle, and even the last of May, is the usual time of putting it in the ground. It grows best in low marshy land, and should be sowed in furrows twelve inches asunder; it requires to be flooded, and thrives best if six inches under water; is occasionally drained off, and turned on again to overflow it, for three or four times. When ripe the straw becomes yellow, and it is either reaped with a sickle, or cut down with a scythe and cradle, some time in the month of September; after which it is raked and bound, or got up loose, and threshed or trodden out, and winnowed in the same manner as wheat or barley.

Husking of rice, in America, is performed by means of a mill, constructed of two large flat wooden cylinders, formed like mill-stones, with channels or furrows cut therein, diverging in an oblique direction from the centre to the circumference, made of a heavy and exceedingly hard timber, called lightwood, which is the knots of the pitch pine. This is turned with the hand, like the common hand-mill. After the rice is thus cleared of the husks, it is again winnowed, when it is fit for exportation.

A bushel of rice will weigh about sixty-six pounds, and an acre of middling land will produce twenty-five bushels.

The dry, or mountain rice, is raised in some parts of Europe on the sides of hills. It is said to thrive well in Cochin China, in dry light soil, not requiring more moisture than the usual rain or dews supply. By long culture, the German rice, raised by the aid of water, is stated to have acquired a remarkable degree of hardness and adaptation to the climate. The upland rice of the United States will grow on high and poor land, and produce more than Indian corn on the same land would do, even fifteen bushels, when the corn is but seven bushels. The swamp rice is more productive in the swamp, in the proportion, as is said, of twenty to sixty bushels per acre; and the use of water likewise, it is stated, makes it easier of cultivation, by enabling the planter to kill the grasses. It is thought that on rich high land, rice may be made to produce twenty-five or thirty bushels to an acre in a good season. A new variety of rice is mentioned as having been discovered in South Carolina, in 1838, called the big-grained rice. It has been proved to be unusually productive. One farmer, in 1840, planted not quite half an acre with this seed, which yielded forty-nine and a half bushels of clean winnowed rice. In 1842 he planted 400 acres, and in 1843, he sowed his whole crop with this seed. His first parcel when milled, was eighty barrels, and netted

half a dollar per cwt. over the primest rice sold on the same day. Another cultivator also planted two fields in 1839, which yielded seventy-three bushels per acre. The average crop before from the same fields of fifteen and ten acres, had only been thirty-three bushels per acre. The experiment of cultivating rice in France appears to have succeeded perfectly. A piece of ground of 100 hectares in extent (250 acres) was sown with rice in 1851, in the lands of Arcachon, near Bordeaux, and the crop proved a highly satisfactory one. The seed is sown about the middle of April, and almost immediately appears above ground. Rice may be kept a very long period in the rough—perhaps a life-time. After being cleaned, if it be prime rice, and well milled, it will keep a long time in any climate; only when about to be used (if old) it requires more careful washing to get rid of the must, which accumulates upon it. Some planters prefer for table use, rice a year old to the new. The grain is superior to any other provisions in this respect. If rice, happen to get wet, only open it to the sun and air, and it will soon dry, and be not at all injured. Rough rice may remain under water twenty-four hours without injury, if dried soon after.

At Munzo, in New Granada, the paddy fields which are not inundated, under the influence of a mean temperature of 26 deg. centigrade (79.0 deg. Fahrenheit), yield 100 to 1.

In Piedmont, where the sowing takes place at the beginning of April, they generally use about fifty-five pounds of seed per acre, and the usual return of a rice field is reckoned at about fifty for one.

Passing eastward, towards Asia, rice is found cultivated in Egypt, becomes more general in Northern India, and holds undisputed rule in the sea boards of the two peninsulas of India, China, Japan, and some of the Eastern islands—shares in the west coasts of Africa with maize, which, on the other hand, is the exclusively cultivated corn plant of the greatest part of tropical America, with only some unimportant exceptions. On the coast of Africa rice ripens in three months; they put it underwater when cut, where it keeps sound and good for some time.

Rice is the staple commodity of Bourbon, and it forms, together with maize and mandioc, the principal article of food amongst the negroes and colored people.

In the Isle of France or Mauritius, rice is cultivated in very damp soils, upon which a great deal of rain falls, but which are not flooded, as in other tropical countries: but the process is not so certain nor the crop so great, as when inundation is employed.

Pulses occupy an important position in the food of the people of the interior plains and

plateaux of India. They are eaten with, and supply to the nitrogenous or flesh forming material in which rice and some other cereals, are defective.

Of the pea tribe, Bengal gram or *Cicer arietinum*, or chick pea, occupies an important position. It is largely used by the people, and constitutes, besides, the chief horse food of Northern and Western India. It can be used for this purpose for a length of time without causing heating: or the other deleterious effects ordinarily produced by the too exclusive employment of peas and beans, other pulses, known as dhal or dhol, are also very largely eaten in northern India, along with rice.

In India generally, rice is produced in every variety of soil, at every altitude and in every latitude. To name a tithe of the varieties grown would prove a tedious and useless task, for they vary with every district in which they grow and the rice of America has also been introduced. The finest is the Bengal table rice, it is inferior to the Carolina kind, and the great bulk of the Indian varieties would be unmarketable in Europe, from their poverty of body and the slovenly manner in which they are prepared. The Aracan rice is a greyish opaque grain, used in England only for manufacturing starch. Copious irrigation is required for all the varieties, the Himalaya and other hill rices alone requiring no such aid, their elevation, at times as much as 6,000 feet, securing them from the great heat to which the other varieties are exposed. Within the province of Bengal, as well as in the Madras low lying districts along the valleys of rivers and near great tanks the principal cultivation is that of rice. In most other districts this vegetable is comparatively rare. There are many varieties of the grain differing widely in colour, shape, and weight; but the ordinary description grown does not extend beyond three or four varieties. The first sowing takes place between the end of March and the latter part of May; and as it matures and ripens within a period of about ninety days, it follows that the harvest takes place between the end of July and the middle of September. This crop is taken from sloping ground not subject to inundation, and is by far the safest, though not by any means the most abundant.

Another sowing takes place on low alluvial tracts between the middle of May and the end of June, and, requiring five months to reach maturity, will be cut between November and January. This is usually the most profitable harvest, although, from the position of the land, liable at certain times to be seriously damaged by inundations; when, indeed, it is not an unusual thing for entire fields to be swept into the rivers. With some cultivators a practice prevails of planting out their rice from nurseries reared near their

dwellings. In this case the plant is removed, when about eight or nine inches high, carried carefully to its destination, which will be some spot that was, perhaps, not available at the proper sowing time; and there the young stalks will be planted in rows, and pressed down about the roots with an inclination towards the direction whence the prevailing wind blows. These plants are said to thrive remarkably if properly placed, and to attain maturity in an incredibly short space of time. Sometimes a heavy flood will unexpectedly sweep away his first planting in which case the ryot repeats the task, knowing well that if it thrive it will amply repay him for his labour by its heavy crops. After the rice-harvest of British India the ground will be sown with some of the innumerable grains grown as cold weather crops.

In the South of India, and along the sea coasts, rice is the favourite food, but from the expenses attending the necessary irrigation it is dearer than other cereals, and the great mass of the labouring people in the interior live on dry grains and pulses. But these again take more time to prepare, more firewood to cook, and so strongly are the people of Southern India impressed with the superior character of rice as food that it indicates their well-to-do or impoverished condition by their telling that they can have rice twice or only once daily or once weekly. Nevertheless, for the labouring man, the value of the dry grains, wheats, pulses and millets are far above rice, as food, and in the Peninsula the health of the jail prisoners has undoubtedly greatly improved by their introduction on Dr. Cornish's recommendation, about the year 1864.

A hill rice grows on the edge of the Himalaya mountains. The mountain rices of India are grown without irrigation, at elevations of 3,000 to 6,000 feet on the Himalaya, where the dampness of the summer months compensates for the want of artificial moisture. But it is also abundantly grown at 6,000 and even 7,000 feet on the Siwalik tract and up the valleys of N. W. Himalaya. The varieties of the hill rice are named *O. mutica* and *O. glutinosa*, and it has been recommended to introduce them into all the mountain ranges of India. Seed is to be had from the Himalaya, (Sikkim,) from Ceylon, Burmah, Cochin-China, Java, &c. Both varieties would be highly appreciated by this staple of food. The former has been reared successfully on the banks of the Thames; near Windsor; and if well up and firmly rooted it will grow through snow.

In *Kashmir*, rice is the staple of cultivation. It is sown in the beginning of May, and is fit to cut about the end of August. The grain is either sown broadcast in the place

where it is intended to stand till it is ripe, or thickly in beds, from which it is transplanted when the blade is about a foot high. As soon as the season will admit, after the 21st of March, the land is opened by one or more ploughings, according to its strength, and the clods are broken down by blows with wooden mattocks, managed in general by women, with great regularity and address; after which water is let in upon the soil, which, for the most part of a reddish clay, or foxy earthy, is converted into a smooth soft mud. The seed grain, put into a sack of woven grass, is submerged in a running stream until it begins to sprout, which happens sooner or later, according to the temperature of the water and of the atmosphere, but ordinarily takes place in three or four days. This precaution is adapted for the purpose of getting the young shoots as quickly as possible out of the way of a small snail, which abounds in some of the watered lands of Kashmir, but sometimes proves insufficient to defend it against the activity of this destructive enemy. When the farmer suspects, by the scanty appearance of the plants above the water in which the grain has been sown, and by the presence of the snail drawn up in the mud, that his hopes of a crop are likely to be disappointed, he repeats the sowing, throwing into the water some fresh leaves of the *Prangos* plant, which either poison the snails or cause them to descend out of the reach of its influence. The seed is for the most part thrown broadcast into about four or five inches of water, which depth is endeavoured to be maintained. Differences of practice exist as to watering, but it seems generally agreed that rice can scarcely have too much, provided it be not submerged, except for a few days before it ripens, when a dried state is supposed to hasten and to perfect the maturity, whilst it improves the quality of the grain. In Kashmir it is customary to manure the rice-lands, which is never done in Hindustan. This manure, for the most part, consists of rice straw rejected by the cattle, and mixed with cowdung. It is conveyed from the home-stead to the fields by women, in small wicker baskets, and is set on the land with more liberality than might have been expected from the distance it is carried. Many of the rice lands are situated much higher than might be thought convenient in Hindustan and are rather pressed into this species of culture than naturally inviting, but still yield good crops, through the facility with which water is brought upon them from the streams which fall down the face of the neighbouring hills. In common seasons the return of grain is from thirty to forty for one, on an average, besides the straw.

In the *Punjab*, rice is grown in many of the plain districts especially along the banks of the

ivers. The rices of the Kangra valley and of Peshawur are celebrated. And the varieties of it are very numerous, the best being the odorous kind called *bas-mati* or *bas-marti*. It is abundantly grown up to 6,000 and 7,000 feet in the Siwalik tract and up the valleys. In Kullu and Lahoul a kind of beer is stated to be prepared from rice, and on the Sutlej it is mixed with the *Hordeum hexastichon* barley for making beer.

In *Lower Sindh* the bhull rice is grown. Like all large rivers which flow through an alluvial soil, for a very lengthened course, the Indus has a tendency to throw up patches of alluvial deposit at its mouth; these are in Sindh called bhull, and are in general very valuable for the cultivation of the red rice of the country. The bhull are large tracts of very muddy swampy land, almost on a level with the sea, and exposed equally to be flooded both by it and the fresh water; indeed on this depends much of the value of the soil, as a bhull which is not at certain times well covered with salt water, is unfit for cultivation. They exist on both sides of the principal mouths of the Indus, in the Gorabaree and Shahbunder pergunnahs, which part of the province is called by the natives "*Kukralla*," and was in olden days, before the era of Goolam Shah, Kalora, a small state almost independent of the amirs of Sindh. On the left bank of the mouths of the river these bhull are very numerous and form by far the most fertile portion of the surrounding district. They bear a most dreary, desolate, and swampy appearance—are intersected in all directions by streams of salt and brackish water, and are generally surrounded by low dykes or embankments, in order to regulate the influx and reflux of the river and sea. Yet from these dreary swamps a very considerable portion of the rice consumed in Sind is produced; and the zemindars, who hold them, are esteemed amongst the most respectable and wealthy in Lower Sind. To visit a bhull the only way is to go by boat, in which it is advisable to take at least one day's provisions and water, as the time occupied in the inspection will be regulated entirely by the state of the tide and weather. To land on any of these places, is difficult, the mud being generally two or three feet deep, and it is only here and there that a footing can be secured, on the embankment surrounding the field. These islands, floating as it were in the ocean, and deriving benefit both from it and the mighty river itself, whose offspring they are, are thus cultivated. Should the river during the high season have thrown up a bhull, the zemindar selecting it for cultivation, first surrounds it with a low bund of mud, which is generally about three feet in height. These bhull being formed during the inundation,

are often considerably removed from the river branches during the low season, when the river has receded to its cold weather level and the bhull is free of fresh water, he takes advantage of the first high spring tide, opens the bund and allows the whole to be covered with the salt water. This is generally done in December. The sea water remains on the land for about nine weeks, or till the middle of February, which is the proper time for sowing the seed. The salt water is now let out, and as the ground cannot, on account of the mud, be ploughed, buffaloes are driven over every part of the field, and a few seeds of the rice thrown into every footmark; the men employed in sowing being obliged to crawl along the surface on their bellies, with the basket of seed on their backs; for were they to assume an upright position, they would inevitably be bogged in the deep swamp. The holes containing the seed are not covered up, but people are placed on the bunds to drive away birds, until the young grain has well sprung up. The land is not manured, the stagnant salt water remaining on it being sufficient to renovate the soil. The rice seed is steeped in water, and then in dung and earth for three or four days and is not sown until it begins to sprout. The farmer has now safely got over his sowing, and as this rice is not as in other cases transplanted, his next anxiety is to get a supply of fresh water; and for this he watches for the freshes which usually come down the river about the middle and end of February, and if the river then reaches his bhull, he opens his bund, and fills the enclosure with the fresh water. The sooner he gets this supply the better, for the young rice will not grow in salt water, and soon withers if left entirely dry. The welfare of the crop now depends entirely on the supply of fresh water. A very high inundation does not injure the bhull cultivation, as here the water has free space to spread about. In fact the more fresh water the better. If, however, the river remains low in June, July, and August, and the south-west monsoon sets in heavily on the coast, the sea is frequently driven over the bhulls and destroys the crops. It is in fact a continual struggle between the salt water and the fresh. When the river runs out strong and full the bhulls prosper, and the sea is kept at a distance. On the other hand, the salt water obtains the supremacy when the river is low, and then the farmer suffers. Much bhull crop is destroyed in the monsoons and during heavy gales. The rice is subject to attacks, also, of a small black sea crab, called by natives *Kookaee*, and which, without any apparent object, cuts down the growing grain in large quantities, and on occasions much loss.

If all goes well, the crop ripens well about the third week in September, and is reaped in the water by men, either in boats, or on large masses of straw rudely shaped like a boat, and which being made very tight and close, will float for a considerable time. The rice is carried ashore to the high land, where it is dried, and put through the usual harvest process of division, &c. : and the bhull is then on the fall of the river again ready for its annual inundation by sea water.

In *Ceylon*, in the Kandian country, when the paddy is to be cultivated in mud, a piece of ground is enclosed in a series of squares or terraces, by ridges raised with mud and turf ; a quantity of water is directed into the field from an adjacent stream or tank ; and is allowed to remain on it for fifteen days, at the expiration of this time the field is ploughed with a yoke of buffaloes, which operation is repeated at the end of fifteen days more, when, by the rotting of the weeds and other matter, the field has become manured. After another interval of fifteen days the field is again ploughed and the broken ridges are repaired. Eight days after, the field is harrowed, and subsequently rolled or levelled ; and when the water has been let out the seed is sown, having in most instances been previously made to germinate, by being spread on platforms and kept wet. The water is turned in during the night, to prevent crabs and insects from destroying the seedlings, and let out during the day ; and this they continue to do till the plants attain the height of one foot. Water is only retained in the field until the ears are half ripe, otherwise they would ripen indifferently and be destroyed by vermin. A variety of coast paddy, called "moottoo samboo," was introduced into the Kandian province in 1832, which was found to produce a more abundant crop, by one-third, than the native. It is of six months' growth.

The *Madras* wild rice, from which all the cultivated varieties of this grain have sprung, is found in the Madras Presidency, in and on the borders of lakes in the Circars, on the Marine lagoons of Travancore near Allepey and other places. This wild rice is never cultivated, though the richer classes near Rajahmundry gather and eat it as a great dainty. It is white, palatable and wholesome and sells at a high price.

In *Travancore* and *Tinnevely*, the rice fields are manured with cow dung, ashes and tree leaves. Rice seed is usually sown broadcast thickly and about 40 days or upwards transplanted, and the usual time from the planting out to the reaping season is about sixty days. When sown broadcast, thinly, to remain, in the same field, that is generally

done about 15 days before the rains set in. It is generally supposed that while growing, the plants cannot have too much water, but as the ears come to maturity, the water is drawn off and the crop lies down under the weight of the ears. Every village has eight or ten varieties, there are 40 or 50 enumerated in the Peninsula of India and Mr. Moon enumerates 161 growing in Ceylon. In South India, generally there are two great crops the Kaar and the Sumbah or Peshanum. The latter is reaped in February and March, and its produce is preferred to that of the Kaar crop which is reaped in October. In the Teling Circars the two crops are designated Poona or early and Pedda worloo or great.

Cuttack.—In *Cuttack*, rice is the staple. It is used for food, for man, beast, and bird ; for the manufacture of starch, the distillation of spirits, &c. Its varieties are as numerous as its uses. There are, in this Province, three distinct crops ; the first, grown on somewhat high ground, is the early crop, sown for the most part in June, and reaped in August and September.

Ganjam.—The exclusive culture of rice in *Ganjam*, *Cuttack* and northwards into lower Bengal has been a cause of much misery and great losses of lives from famines occurring through the failures of the periodical rains, and Mr. Thornhill in 1872 counselled the partial culture of other cereals, pulses and millet.

When the field is prepared by being reduced to soft liquid mud, it is astonishing to see how soon a few labourers will plant a field, after which to keep the plants supplied with a suitable quantity of water is all that is needed, and some sorts need very little but others a great deal. After being cut down with the sickle, the produce is carried to a dry spot where it is trodden out by cattle or temporarily stacked.

The *rice of Bengal*, by the exercise of some care and skill, had been, by the middle of the 19th Century, so far improved as nearly to equal that of the Carolinas. Dr. Falconer introduced the numerous and fine varieties of rice cultivated in the Himayala ; of these some of the best sort were at his suggestion distributed to cultivators along the Doab canal. The early, or "aous" rice is sown generally on high, light, and sandy soils from March to May, as showers may be favorable. It is cut variously from the end of July to the middle or end of September, and in six weeks' time, it is succeeded by what is known as 'cold weather' crop, which may be mustard, vetches, pulse, millet, sola, or gram, barley, oats, and the like. The "aumon" rice is sown in rich, deep, and loamy soils from April to June, and is reaped any time between the beginning of December and the end of January. It is a

richer, stronger, and every way a better crop than the "aous," but it is more exposed to inundation, and is not followed by any second crop within the year. Occasionally the early and the late crops are sown on the same land, and cut without injury to each other at different periods. A large part of the late rice is planted with the hand in rows, on land carefully ploughed, cleaned, and smoothed for the purpose. It is everywhere known as the "roa," and yields an abundant harvest. A third kind of rice, unknown in high and dry tracts of country, but very common in extensive marshy districts, is called the "boru," and from its proximity to water, is sown and grown from the month of January to the end of May. It is cultivated in places where there is too great a depth of water during the heavy rains, and consequently abundance to keep the plant moist during the fierce heat of summer. The early rice, in the most favorable season, from both grain and straw, cannot give more than five rupees per beegah. In bad seasons it may not yield more than one rupee. As much as ten or even fifteen rupees may be got from the aumon crop in good seasons; but when heavy rains, or unexpected inundations from large rivers, drown the young plants, as was the case during 1855 and 1856, and may be the case again at any time, the return is positively nothing. The "boru" rice may be expected to yield seven or eight rupees per beegah. And on these three crops, over some hundreds of miles, the hopes and anxieties of some millions hang for a large part of the year. The condition of those who live by such crops, we have found to be as follows:—Take a large plain, a crowded bazaar on market day, or a high road between two towns or villages of any importance, and it will generally be found that the men at work on the one, or buying and selling in the other, or sturdily strutting along the third, have some title, or right, or interest, or occupancy in the soil. Nearly every man has his "jumma," which is his tenant-right of occupancy, or of proprietorship. The extent of this jumma is, in conversation, and for all practical purposes, indicated not by the acreage, for few can tell the area of their possession, but by the rent demanded, for every man well knows how much he is expected to pay. A "jumma" or "jote" may then vary from five rupees to one hundred rupees. It will usually be found to be from about twelve to thirty. Obviously, the possibility of a man's paying such rent, and yet finding enough to support him, will depend, apart from all fluctuations of climate, on the rent, compared to the productiveness and extent of the tenure, on the number of mouths which he has to support in his own homestead, and on the number of sharers

who have a joint hold on the land. The shareholders in a large jumma of eighty or one hundred rupees have been known to reach to ten, and there are often as many as four or five on a small holding of twenty rupees. This is an inevitable consequence of the law of subdivision, but it is remarkable how constantly this terminates after two or three generations, in a separation of cousins, and a division of the inheritance into two or more shares, no longer to be held in common: and it is still more remarkable how this universal custom is rudely set to rights by the progress of disease by fever, cholera, small pox, and other scourges, which clear off whole families, and cause the inheritance to revert to the hands of a single member. If on the one hand, numerous instances may be found of families branching out, till they seem to weigh down the minute holding,—on the other, cases as frequent will occur, where father and uncles, with their offspring, have all been swept away, and the patrimonial inheritance has reverted to a single individual, with, it may be, the surviving female relations all dependent upon his exertions for bread. The jumma or holding will naturally be divided between a homestead, or "beeta," with, it may be, some garden land attached to it, and the outfield in the plain, with its early or late rice, or both. The main question relative to outfield and infield will, of course, be the average amount of rent. Few Bengal ryots really know the extent of their holdings in actual beegahs. This is the case, in many instances, where the land has never been measured, when it will be loosely stated at twenty or thirty beegahs; but if it has been measured, the ryot unluckily knows its extent but too well. There is in every pergunnah a variable rate of assessment, but one well understood.

There is, however a general understanding, expectation, or regular consent, given, or implied, that it shall not be enhanced without some very special reason. And the question to which we now come, and which is one of the last importance, is, what is the usual average, and is it a fair one? On this point, custom and opinions vary so much, in different places, and according to the different views of payers and receivers, that it is with some difficulty, and after a great deal of research, that we have arrived at a definite conclusion. Even in villages, a higher rate on the homestead and the garden, is universal. It may be as low as Rs. 2, or as high as Rs. 3-8 or Rs. 4 but the average may be taken as Rs. 2-8 or Rs. 2-12. Such rate, in itself, is nothing intolerable. What is a fair rent for the land which yields one splendid crop, or two average crops in the year? We find that

The rent of this land varies from as low as 8 annas a beegah to Rs. 2-18 and even Rs. 8, which is pretty much the same as saying that rent in England ranges from eighteen shillings or one pound an acre to fifty and fifty-five shillings. In Bengal the extremes are rare. The land may be too sandy, or too low, or too sterile, or impregnated with salt, or culturable only after a rest for a year or ten months, and in these cases, a rate of from ten to fourteen annas is quite as much as it can bear. If rich and loamy, it may well bear from eighteen to twenty annas. But repeated investigation has shown, that a ryot holding a jote of twenty beegahs, composed of homestead, high land, and deep land, pays on the whole a higher rate than this. Were the whole of the twenty beegahs assessed at no more than a rupee per beegah, we should have little to say in favor of a reduction. But when the homestead pays Rs. 2-8 or Rs. 3, the deep rice land Rs. 1-8, to 1-12 or Rs. 2, and the lighter soils from twelve annas to Rs. 1-2, as they do pay repeatedly, it is clear that the ryot has a burden laid on him, which it requires constant exertion, without intermission from sickness, litigation, or any other cause, as well as a succession of favorable seasons to enable him to support. In round numbers one rupee a beegah, or Rs. 1-2 and perhaps Rs. 1-4 in very favorable localities, would be a fair and equitable assessment. But we find in some pergunahs, that Rs. 1-4, and in others that Rs. 1-6, and Rs. 1-12, or Rs. 2 are the regular rates. Add to this occasional cesses, with an increasing family, and the families of other shareholders increasing as well, and it is very conceivable that the ryot has no easy task to perform.

To meet the rent, the ryot or tenant proprietor cultivates his land in one of the three following ways : 1, by his own thews and sinews : 2, by the labour of hired servants : 3, by the system of barga. By far the greater part of the rice crop is sown and grown by those to whom the holding belongs. The ploughing, crushing, and barrowing, the casting of the seed, the weeding during the rainy season, the cutting and carting, are most frequently all done by the holders of the jote. Hired labour is, obviously, an indication of some advance in civilization or of some substance and well being. It is the frequent resource of men who have taken service under Government, or under Zemindars, or who, with an under tenure, comprising one or more villages, retain in their own hands a small home farm. The third method of cultivation is very frequent. The proprietor having neither the skill, nor the time, nor the muscle, to sow and plough himself calls in a person whom he terms the bargadar. This person

brings his own plough, bullocks, and seed and his own person and goes through all the agricultural operations, which commence in April and end in December. Having done this without any advances from the proprietor, —who does not always give one-half the seed, as stated by Mr. Wilson in his glossary,—the bargadar, at harvest-time, gets for his pains, just one-half the crop. The arrangement suits the convenience of both parties. The tenant is saved the exertion of cultivating and can follow any other business. The bargadar, who may work in one village this year, and in another the next, is saved anxieties about leases, exertions, bonuses, and payments of rent, &c. In the very worst of seasons, he has lost nothing beyond his seed and his labour. But of the three methods of cultivation, the most frequent as well as the most successful, is the first. Ryots admit that, if a man want careful ploughing, sowing, and planting, the young plant to be well weeded, and the surplus water to be regularly carried off, with a first-rate crop at the end of all, there is nothing for it but to do everything himself. The tools are primitive, the ryot is often lazy, and there is little change in the system of cropping from one year to another ; but not in any part of England itself, with all the elaborate ploughs of modern invention, are there to be shown such specimens of finished and successful husbandry, as in Bengal.

A knowledge of the best system of rotation, and of the best and simplest ways of manuring and irrigating such crops, is what the ryot has not got, and what it would be well to give him ; fruit trees and vegetables, if properly looked to, would become more valuable. And there is little doubt that as railways are extended through eastern and northern Bengal, there will be many more inducements to the ryot to cultivate those productions, which find a ready sale only in large stations and prosperous cities. But, with all this, a very large surface of ground will ever remain fitted for rice cultivation alone. This must be the case until scientific men shall discover some means of draining off the accumulation of water of the rainy seasons, which the thousand natural outlets of the country have yet failed to do ; or some article of general consumption be found, which possesses the peculiar faculty of growing in from six inches to six feet of water, and which, with a fair chance given it will beat Neptune in a race for life or death. There may be several places, where, by cutting a canal and letting the water run off into some deep river, having its exit in the Sunderbunds, a good many acres of land might be saved from annual inundation, and bear crops of rice, instead of jungle with a

broad blade. But such places are suited to engineering and not to agricultural triumphs ; and it is everywhere recognized that persons intending to teach the ryot some parts of his trade, would be rather surprised to find how very much they had yet to learn. His knowledge of seed time, and of harvest, and the general water-shed of his part of the country, is hardly susceptible of improvement ; while the pains and labour, though unwilling, with which considerable patches of ground are cleaned and smoothed for the reception of rice plants, dibbled in by rows, with the hand, after being grown in a sort of nursery as well as the results of these divers operations, would be worthy of all praise in an agricultural show in England. The implements, by which these gratifying results are attained are a Bengali plough, a rude implement, suited to the means and capacity of the ryot, and to the bullocks which are to draw it. The ryot finds his baubul wood, preferred for its hardness, as well as the piece of iron for the share, and the carpenter of the village, for a remuneration of four annas, will "fix" him a plough. It is usual to give the village carpenter a general retainer for the year, in the shape of a maund of rice in the husk, in consideration of which he is to make and repair the plough and other agricultural weapons ; or the ryot may buy his plough ready made. In any case the whole expense will not exceed Rs. 1-4 or 1-8 for wood, iron, and workmanship ; and the article may last one, two, or even three years. The prices of bullocks, which draw the plough or the cart, vary according to the size and strength of this animal. A young and vigorous bullock will fetch from eight to ten, twelve, and even sixteen rupees. Twenty rupees for a good pair is not an uncommon price. Weak and puny animals, or those whose best days are past, will cost four, five, or six rupees each. Eight rupees is about an average price. The arrow is nothing more or less than two bamboos tied parallel to each other by cross pieces of wood, so as to form a regular ladder about eight feet long. The bullocks being harnessed, a couple of men take their stands on the ladder, so as to increase its weight, when it is dragged repeatedly over the field on which the seed has been cast, till every clod is pulverised, and the whole surface is perfectly smooth. We might term this a clod-crusher ; the natives call it a "bida" or "bichara." It costs about two annas, and may be put together by the ryot himself. The instrument which resembles a harrow, in that it shows one single row of wooden teeth, is not employed till the seed has shot up some inches above the ground, when it performs somewhat of the duty which the 'scuffler' performs in Britain preventing

the soil from caking and hardening, without tearing up the young and tender plant. This instrument may be purchased for about six annas. Add to this a small hand-spud for weeding, which costs about three pice : a fish basket to catch, rather than to carry fish, which costs about three annas ; a triangular fish net, which is worth about five annas ; a kodali or mattock, which, however is not universally needed, worth little more than a rupee ; a dao or bill-hook worth about eight or ten annas, —and we have the complete stock in trade of a very considerable portion of the labouring population of Bengal. Of acute misery, helpless indigence, and downright wretchedness, there is really very little amongst the ryots of Bengal. Heat is at least as bearable as extreme cold. The poor man has in Bengal, like the poor man elsewhere, a certain amount of inevitable hardship. Agricultural operations demand considerable, not to say severe, labour. A ryot, we will say, gets up in the morning, when he eats his pan and supari, or betelnut and leaf, if he can afford it, or takes a few whiffs of his hookah. Going to the field about eight, nine, or ten o'clock, he comes home for his mid-day meal, except at ploughing-time, when if delay be highly objectionable, his food is sent out to him by one of his sons or nephews. After eating, he returns to work again, often till past sunset. An active limbed man will plough one beegah a day, but will drive the clod-crusher or the harrow over eight or ten times that extent. It is a very good day's work, when weeds are plentiful, to clear one quarter of a beegah of rice land if so much. And to plant a whole beegah with rice sprouts sown elsewhere and transplanted at a favorable moment, is enough for three men in a day. This latter operation is especially fatiguing, as the workman is constantly in a stooping position. Weeding is comparatively easy, though the feet and ancles are soaked in mud and water for hours, because the ryot literally squats down with an umbrella of matting fixed tightly over his head, without a handle, and moves on gradually as he clears a little circle round him. A pleasing feature in these operations is the invariable custom of the ryots to help each other. Half the village turn out and weed the plot of Gopal one day, of Tin Kouri the next, and of Panchoo on the third. The rice gets thus a regular clearing on one and the same date, and two or three clearings are enough for an ordinary crop.

Oudh.—Very many varieties of rice are grown in Oudh. A heavy soil and plenty of water suits them best. There are five kinds which are considered among the best ; Mihee and Bansee are foremost. The peculiarity in the cultivation of these two kinds is that they are transplanted

and placed about 5 inches apart. And, by this method, if the soil is good, they grow to the height of an ordinary sized man, and produce a much larger quantity than if otherwise treated.—The odour and flavour of these two kinds, when cooked, are superior to those of any other kind. They are only used by those who can afford to buy them. As the labour in cultivating them makes them dearer than the other sorts, the three other varieties which are considered good are the Bateesa, the — ? and the Phool Birinj. They are sown broadcast in June, and left so, and they are the kinds mostly used by natives. The first two mentioned, when new, sell for 10 or 12 seers per rupee, and become dearer according as they become older. The other three kinds sell for about 19 seers per rupee, and are dearer if older. Some consider Phool Birinj the best, as it swells in boiling, and has an agreeable odour.

Assam.—In the Assam valley, in the seaboard of Chittagong, Arracan, Pegu, the valleys of the Burmah and Pegu rivers, in Amherst, the Tenasserim Provinces, Province Wellesley, Siam, Cochin-China, Cambodia, China, and the great Islands of the Archipelago rice is the chief grain food.

Arracan.—The fertility of this province is very great, its soil being fit for the culture of nearly all tropical productions; rice, however, is alone cultivated to any great extent; the low alluvial soil which extends over the whole country, from the foot of the mountains to the sea, being admirably suited for its growth. About 115 square miles are under culture with rice. The export trade in rice of the district from 1831 to 1843 ranged between 400,000 and 2,600,000 maunds, valued at from £180,591 to £1,131,087.

In *Burmah and Tenasserim*. A rice is universally cultivated, and cultivation has produced many varieties. The Karens have distinctive names for more than forty. and Karen mountain rice is preferred by many to that which is raised by the Burmese on the low lands; yet it is said not to be so nutritious, and on this account bears a less price in the bazaar. It is of all colors from ivory-white to coal-black. Of the black rice the Karens prepare a kind of bread, which to them supplies the place of ginger bread. A portion of seethed rice is poured into a large mortar with a prodigious quantity of sesamum seeds. Two women then take their strong ebony pestles and pound it, striking alternately until it becomes a light bounding mass. It is then thrown upon the eating stand, when the whole family seat themselves around it in oriental style, and sever it with their sabres. The Karens have another mode of preparing this kind of rice, which is particularly convenient for travellers. A quantity unboiled

is thrust into joints of small bamboos, a little water added, and the orifice closed up. It is then roasted, and if eaten with a little butter and salt it is most delicious. The Karen select only two varieties of bamboo for this purpose, and these impart to the rice a sweet delicate flavor. The Burmese rear nearly a hundred varieties of rice, but the principal distinctions between the different kinds are as follows:—Hard grain, soft grain, glutinous rice. The “Natsung” is the hardest grain, and is the rice which is principally exported to Europe. The “Meedo,” is the chief of the soft grain varieties. It is much preferred by the Burmese to the hard grained sorts, and it is certainly superior in taste when cooked; but the hard grained rice is chiefly purchased by the merchants for export, as it keeps better, and the soft grained rice is too much broken by European machinery in cleaning. Latterly, on the continent, this last objection appears to have been overcome, and a greater demand is consequently springing up for the Meedo rice for the markets of foreign Europe. The *Koungyueen*, or hill rice of Burmah and Tenasserim, is called glutinous rice by Europeans, from the property it possesses when cooked, the grains all adhering in a thick glutinous mass. It is the chief article of food with the Karen and other hill tribes, but is not much eaten by the inhabitants of the low swampy plains, where the common rice is grown.

Province Wellesley.—Rice land gives an average return of 117½ fold; the maximum degree of productiveness being 600 guntang of paddy to an orlong of well flooded, alluvial land, or 150 fold, equal to 330 guntang of clean rice, weighing nearly 4,520 English pounds. The present average produce has been very moderately estimated at 470 guntang the orlong of paddy. The quantity of seed invariably allotted for an orlong of land is four guntang. In Siam, forty fold is estimated a good average produce. At Tavoy, on the Tenasserim coast, the maximum rate of productiveness of the rice land was, in 1825, and is still believed to be, nearly the same as the average of Siam; while their average was only twenty-fold.

Siam.—Rice is used by the Siamese poor as the main aliment of life; by the opulent, as an accompaniment to their meals, as bread in Europe. Glutinous rice is employed either in flour or grains. A favorite cake is thus prepared:—the rice is cooked without water or steam; it is then sprinkled with condiments consisting of ginger and other spices; it is divided into small parcels which are wrapped up in plantain leaves, and in twenty-four hours a sweet and vinous liquor exudes, when the cake is fit for eating, if kept longer they become intoxicating.

and if distilled produce arak, which, subject to re-distillation, gives a strong and fragrant drink.

In *Cochin-China*, rice is the "staff of life," and forms the main article of culture. There are six different sorts grown; two on the uplands, used for confectionery, and yielding only one crop annually; the other sorts affording from two to five crops a year; but generally two, one in April and another in October; or three when the inundations have been profuse.

China—The late Dr. Gutzlaff stated, at a meeting of the Statistical Society of London, that the population of China was about 367,000,000 and the returns of the land subject to taxes used in rice cultivation there, gave nearly half an acre to each living person; and he further stated that in the southern and well watered provinces, it is anything but uncommon to take two crops of rice, one of wheat and one of pulse, from the same land in a single season. Rice is the only article the Chinese ever offer a bounty for; the price fluctuates according to the season, from one and three-quarter dollars to eight dollars per picul. Siam and the India Islands, particularly Bali and Lombok, supply the empire occasionally with large quantities. The price of rice in China varies according to the state of the canals leading to the interior; if they are full of water the prices rise; if on the contrary they are low, prices fall in proportion at the producing districts. The amount of consumption is controlled, in a considerable degree, by the cost of transit; when this is cheap prices rise from the general demand; but when land carriage to any extent has to be resorted to, they fall; it raises prices so much at any great distance, that rice must be used very sparingly, from its enhanced price. It is obvious that if the waters are sufficiently high to allow a boat to pass fully loaded, she does so at an expense of nearly 50 per cent less than she would do, if, from want of water, she could only take half the quantity; when transport is cheap every one obtains a full supply; when it is dear the rice districts have more than they can consume. In Europe, people are so much accustomed to the facilities of transit offered by railroads, boats, &c., that they do not readily take into consideration, that in China, except by water, all articles are conveyed from one place to another on men's shoulders. Taking the population of Canton at the usual estimate of a million, and allowing to each a catty a day, the quantity of rice required for one day's consumption alone in that city would be 10,000 piculs, of 133 lbs. each = 1,340,000 lbs.

In China, during the growth of the rice the fields are always kept flooded when water can be obtained. The terraces near the base of the

hills are supplied by the mountain streams, and the fields which are above the level of any adjoining river or canal are flooded by the celebrated water wheel, which is in use all over the country. These machines are of three kinds. The principle in all of them is the same, the only difference being in the mode of applying the moving power, one is worked by the hand, another by the feet and the third by an animal of some kind, generally a buffalo or bullock. The rice lands are kept flooded in this way until the crops are nearly ripe, when the water is no longer necessary. It is also necessary or at least advantageous to go over the ground once or twice during the summer, and stir the soil up well amongst the roots, at the same time removing any weeds which may have sprung up. If the weather is wet, the fields retain the water for a considerable time, and then it is not an uncommon sight to see the natives wading nearly up to the knees in mud and water, when they are gathering in the harvest. In the island of Chusan, and over all the rice country of Cheking and Keangsoo, there are two plants cultivated in the winter months, almost exclusively for manure; the one is a species of *Coronilla*; the other is trefoil, or clover. Large ridges not unlike those where gardeners grow celery, are thrown upon the wet rice-fields in the autumn, and the seeds of the plants are dropt in, in patches at five inches apart, on the surface of the ridges. In a few days germination commences, and long before the winter is past the tops of the ridges are covered with luxuriant herbage. This goes on growing until April, when it is necessary to prepare the ground for the rice. The ridges are then levelled and the manure plants are scattered in a fresh state over the surface of the ground. The fields are flooded, and the plough and harrow are employed to turn up and pulverise the soil. The manure thus scattered over the ground and half buried amongst the mud and water, begins to decay immediately, and gives out a most disagreeable putrid smell. This mode of manuring is generally adopted in all the rice lands in this part of China, and the young paddy doubtless derives strong nourishment from the ammonia given out in the decomposition of this fresh manure. Firewood is so scarce in the country that a great portion of the straw, cotton stalks, and grass which would go to manure the fields, is used for firing, and therefore, the plan of growing manure for the land is forced upon the farmers by necessity. The plan of using manure in a fresh state, instead of allowing it first to decay, has doubtless been found from long experience to be the best for the young paddy. The Chinese farmer is not a chemist, he knows little or no-

thing of vegetable physiology, but his forefathers have hit accidentally upon certain systems which are found in practice to succeed, and to these he himself adheres and hands them down unchanged to his children. The glutinous rice of the Chinese, contains much dextrine and is preferred for making conjee, dumplings and wine. The Chinese of Honan, Shen-si, Shan-si and Shantung prefer wheat to rice.

Java is the granary of plenty for all the Eastern Archipelago ; and the Dutch East India Company occupies itself in this culture with solicitude, well persuaded that a scarcity of rice might be fatal to its power. Ordinances to encourage and increase this branch of agriculture, have been promulgated at different times by an authority called to watch over the physical well-being of many millions of inhabitants. As an evident proof that the culture of rice, of which it would be difficult to fix the quantity produced annually, increases considerably, it may be mentioned that the exportation from Java, in 1840, was 1,488,350 piculs of 125 Dutch lbs. Rice is cultivated in Java in three systems. The name of "Sawah" is given to the rice fields, which can be irrigated artificially ; *tepar*, or *tagal*, are elevated but level grounds ; and *gagah*, or *ladang*, are cleared forest grounds. The two last only give one crop ; a second crop may be obtained from the sawah, which then most commonly consists of *katjang*, from which oil is extracted, in *kapus* or fine cotton, and in *ubie*, a kind of potato. There are, says Mr. Crawford, two distinct descriptions of rice cultivated throughout the Indian islands, one which grows without the help of immersion in water, and another for which that immersion is indispensably requisite. In external character there is very little difference between them, and in intrinsic value not much. The marsh rice generally brings a somewhat higher price in the market. The great advantage of this latter consists in its superior fecundity. Two very important varieties of each are well known to the Javanese husbandman, one being a large, productive, but delicate, grain, which requires about seven months to ripen, and the other a small, hardy and less fruitful one, which takes little more than five months. The first we constantly find cultivated in rich lands, where one annual crop only is taken ; and the last in well watered lands, but of inferior fertility, where the two crops may be raised. Both of these, but particularly the marsh rice, is divided into a great number of sub-varieties, characterised by being awned or otherwise, having a long or round grain, or being in color black, red, or white. The *Oryza glutinosa*, of Rumphius, is never used as bread, but commonly prepared as a sweetmeat.

The rudest, and probably the earliest practised mode of cultivating rice, consists in taking from forest lands a fugitive crop, after burning the trees, grass, and underwood. The ground is turned up with the mattock, and the seeds planted by dibbling between the stumps of trees. The period of sowing is the commencement of the rains, and of reaping that of the dry seasons. The rice is of course of that description which does not require immersion. The second description of tillage consists also in growing mountain or dry land rice. This mode is usually adopted on the common upland arable lands, which cannot conveniently be irrigated. The grain is sown in the middle of the dry season, either broadcast or by dibbling, and reaped in seven or five months, as the grain happens to be the larger or the smaller variety. The culture of rice by the aid of the periodical rains forms the third mode. The grain being that kind which requires submersion, the process of sowing and reaping is determined with precision by the seasons. With the first fall of the rains the lands are ploughed and harrowed. The seed is sown in beds, usually by strewing very thickly the corn in the ear. From these beds the plants, when 12 or 14 days old, are removed into the fields and thinly set by the hand. They are then kept constantly immersed in water until within a fortnight of the harvest, when it is drawn off to facilitate the ripening of the grain. The fourth mode of cultivating rice is by forcing a crop by artificial irrigation, at any time of the year ; thus, in one field, in various plots, the operations of sowing, ploughing, transplanting, and reaping may be seen at the same period. Mr. Crawford, says he had seen lands which had produced, from time beyond the memory of any living person, two yearly crops of rice. When this practice is pursued, it is always the five months grain which is grown. The rapid growth of this variety, has, indeed, enabled the Javanese husbandman, in a few happy situations, to urge the culture to the amount of six crops in two years and a half. Rice cultivated in a virgin soil, where the wood has been burnt off, will, under favorable circumstances, give a return of twenty-five and thirty fold. Of mountain rice, cultivated in ordinary upland arable lands, fifteen fold may be looked upon as a good return. In fertile soils, when one crop only is taken in the year, marsh rice will yield a return of twenty-five seeds. When a double crop is taken, not more than fifteen or sixteen can be expected. In the fine province of Kadu, an English acre of good land, yielding annually one green crop and a crop of rice, was found to produce of the latter 94 lbs. of clean grain. In the light sandy, but well watered lands of the province of Mataram,

where it is the common practice to exact two crops of rice yearly without any fallow, an acre was found to yield no more than 285 lbs. of clean rice, or an annual produce of 560 lbs.

Celebes.—Rice is grown to some extent in the Dutch portion of Celebes; it yields at a minimum one hundred and fifty fold. The average annual delivery of rice to the Government pays sixty cents for a measure of forty pounds. That which is sold for the consumption of the inhabitants may be procured at the public warehouse for a guilder at 35½ lbs.; and that which is sold for export may be had at public auction for 125 florins the coyan of 3,000 lbs.

In the Philippines, nine varieties of rice are cultivated, distinguished as under,

Binambang	Malagoquit (b)	Quinanda
Lamuyo	Bontal Cabayo	Bolohan
Malagoquit (a)	Dumali	Tang-i

The Lamuyo forms the principal article of food of the inhabitants of the coast, the malagoquit (a) is glutinous and used for making sweetmeats and fancy dishes.

Rough rice, "paddy," or grain, as it comes from the ear, is composed, first, of a rough, silicious outer covering, impervious to water, which is very useful in the neighbourhood of cities, for filling up low lots or pools, for horse beds, and for packing crockery and ice, being far better for the latter purpose than saw-dust; second, a brown flour or bran, lying directly under the outer covering; and third, the clean or white rice. The outer flour, or brown bran, which is separated from the chaff is known as "rice flour," and corresponds to the "bran" of wheat, it is a most excellent food for horses, poultry, pigs and milch cows, and always commands a ready sale. It is used extensively for these purposes at and around Charleston, and is shipped thence, by the cargo, to Boston and other Northern ports of N. America.

Rice is exported to Europe from Brazil, Java, Bengal, Arracan and Pegu. That from Arracan is generally exported unshelled, as paddy. The exports from India, were mostly from Bengal and Madras.

1850-51	Qrs.	771,572	£ 672,438
1851-52		921,555	777,030

1860-61		84,491,714	2,673,840

The imports into Great Britain from 1847 to 1857, ranged from 88,529 to 78,658 tons.

The people in the N. W. Himalaya make a wine from rice, and from rice and barley they prepare a beer. In making the arrack of the south of the Peninsula of India, rice forms an ingredient. The Lau spirit of the Siamese, the Badek and Brom of the Javanese, the Saki, sam-su and san-chu of the Chinese are all made from rice.—*McOulloch's Com. Dic.* p. 985. *Neilgherriensis, Ootacamund, 4th May 1861. Dr. J. L. Stewart. Punjab Plants*, p. 257. *Capper's Three Presidencies of India. RICE BIRD. *Loxia oryzivora. Linn.*

Java Sparrow,	Glate.....	JAV.
Paddy Bird... ..	ENG.	Burung pipi..... SUMAT.

A bird of the East Indies.

RICE FLOUR, is ground rice. The seeds of rice contain a much less proportion of nitrogenized compounds than the other cereal grains, and particularly wheat: viz., about seven per cent.—the quantity of fatty matter is also less, and, though much difference of opinion has prevailed in reference to the value of rice as an article of diet, analysis clearly proves that it is the least nutritious of all the cereal grasses. This difference of opinion has probably arisen from the fact that rice is seldom eaten by itself, but is partaken of usually with milk, butter, or sugar, the nutritious properties of which substances have been attributed to the rice itself. The Chinese prepare a flour Mifen, by boiling rice and drying it in the sun and the clear grains are ground into a flour which makes an excellent gruel.—*Hassell's Adulterations of Food. Dr. Smith's Materia Medica of China.*

RICE GLUE, or Japanese Cement is made by mixing rice flour intimately with cold water, and boiling the mixture. It is white, and dries nearly transparent, hence its use in making many articles in paper. When made with a

smaller quantity of water, models, busts, &c., may be formed of it.—*Tomlinson*.

RICE MILL, various machines have been contrived for cleaning rice, one of which, secured by patent to Mr. M. Wilson, in 1826, consists of an oblong hollow cylinder, laid in an inclined position, having a great many teeth stuck in its internal surface, and a central shaft, also furnished with teeth. By the rapid revolution of the shaft, its teeth are carried across the intervals of those of the cylinder, with the effect of parting the grains of rice, and detaching whatever husks or impurities may adhere to them. A hopper is set above to receive the rice, and conduct it down into the clear cylinder. About eighty teeth are supposed to be set in the cylinder, projecting so as to reach very nearly the central shaft, in which there is a corresponding number of teeth, that pass freely between the former. The cylinder may also be placed upright, or horizontal if preferred, and mounted in any convenient frame work. The central shaft should be put in rapid rotation, while the cylinder receives a slow motion in the opposite direction. The rice, as cleaned by that action, is discharged at the lower end of the cylinder, where it falls into a chute, and is conducted to the ground. The machine may be driven by hand, or by any other convenient motive power.

A simple but rude mill is in use in most parts of South Eastern Asia, for hulling paddy, and is similar to those used 4,000 years ago. It consists of two circular stones, two feet in diameter, resting one on the other; a bamboo basket is wrought around the upper one so as to form the hopper. A peg is firmly set into the face of the upper stone, half way between its periphery and centre, having tied to it by one end a stick three feet long, extended horizontally, and attached by the other to another stick pending from the roof of the shed under which the mill is placed. This forms a crank, by which the upper stone is made to revolve on the other set firmly on the ground. The motion throws the rice through the centre of the stone, and causes it to escape between the edges of the two stones.

At Rangoon, a mill is in use which was invented by Thomas Sutherland, merchant and mill-owner, Melbourne, Australia, at which place the first mill was erected, and is now working. By it, three hundred and fifty tons can be turned out in the twenty-four hours, with a mere trifle as to manual labour, as nearly all the work is done by machinery. The value of rice produced by this Company's mills is already valued at 1 sh. a cwt: over native cleaned rice; but it is believed, when the trade once know the quality, it will fetch 2 sh. a cwt. over any hand-cleaned rice.

About the year 1830, the planters of America began experiments with rice mills and about that year saw the first working of a small mill. The rice threshing-mill, steam engine attached, is now a splendid piece of operative machinery. The rice in sheaf is taken up to the thresher by a conveyor, it is threshed, the straw taken off, then thrice winnowed and twice screened, and the result in some cases exceeds a thousand bushels of clean rough rice, the work of a short winter day.—*Hassell. Dict. of Arts and Manufactures. Cat. Ex. 1862.*

RICE PAPER PLANT, *Aralia papyrifera*.

Tung-to-mu..... CHIN.

Grows abundantly in its wild state in numerous parts of Formosa. The rice paper is brought from China in plain and dyed sheets and not unfrequently with various coloured designs on them. The source of this product continued long a matter of doubt, but it is now equally certain that it is produced from the *Aralia papyrifera*. Yoksun in Sikkim, occupies a very warm sheltered flat, many tropical genera occur, such as tall bamboos of two kinds, grasses allied to the sugar-cane, scarlet *Erythrina*, and various *Araliaceæ*, amongst which was one species whose pith was of so curious a structure, that Dr. Hooker had no hesitation in considering the then unknown Chinese substance called rice-paper to belong to a closely allied plant. The Chinese rice-paper has long been known to be cut from cylinders of pith which has always a central hollow chamber, divided into compartments by septa or excessively thin plates. The above supposition was confirmed, by Sir William Hooker receiving from China, after many years of correspondence, specimens of the rice-paper plant itself which very closely resembles, in botanical character as well as in outward appearance of size and habit, the above Sikkim plant.—*Dr. Hooker's Jour., page 359. Faulkner. Fortune's Res. among the Chinese, p. 197. Dr. Smith's, Mat. Medica of China.*

RICE SPROUTS.

Kuh-ya..... CHIN. | P'ih-mi..... CHIN.

In China, rice in husk is called kuh. Rice germinated and dried is used as a peptic and tonic remedy, having much the same effect as the germinated barley or malt. The sprout is sometimes rejected, sometimes retained.—*Dr. Smith's Mat. Medica of China.*

RICE STARCH, starch is more abundant in rice grain than in wheat. Jaconnet obtained from Carolina rice 85.07, and from Piedmont rice 83.8 per cent. of starch. Vogel procured from a dried rice no less than 98 per cent. of starch. For purposes of ordinary starching, the peoples in the East Indies use the water in which rice has been sometime boiled, called conjee or gunji in India, and

in Chinese Mi-t'ang. A starch from rice is prepared in China, called Mi-tsiang-fen. It is the Mi-t'ang mixed up with powdered gypsum, the product cut up in thin rectangular cakes and dried in the sun. For starch making, great shipments of rice are now made from Calcutta, Akyab, Rangoon, Moulmein and Cocanada. There are several patent processes in existence for the manufacture of rice-starch, which are accomplished chiefly by digesting rice in solutions, more or less strong, of caustic alkali (soda), by which the gluten is dissolved and removed, leaving an insoluble matter composed of starch, and a white substance technically called fibre. Under Jones' patent, the alkaline solution employed contains 200 grains of real soda in every gallon of liquor, and 150 gallons of this liquor are requisite to convert 100 lbs. of rice into starch. In manufacturing rice-starch on a large scale, Patna rice yields 80 per cent. of marketable starch, and 8.2 per cent. of fibre, remaining 11.8 per cent., being made up of gluten, gruff, or bran, and a small quantity of light starch carried off in suspension by the solution. Jones' process may be thus described:—100 lbs. of rice are macerated for 24 hours in 50 gallons of the alkaline solution, and afterwards washed with cold water, drained, and ground. To 100 gallons of the alkaline solution are then to be added 100 lbs. of ground rice, and the mixture stirred repeatedly during 24 hours, and then allowed to stand for about 70 hours to settle or deposit. The alkaline solution is to be drawn off and to the deposit cold water is to be added, for the double purpose of washing out the alkali and for drawing off the starch from the other matters. The mixture is to be well stirred up and then allowed to rest about an hour for the fibre to fall down. The liquor holding the starch in suspension is to be drawn off and allowed to stand for about 70 hours for the starch to deposit. The waste liquor is now to be removed, and the starch stirred up, blued, (if thought necessary), drained, dried and finished in the usual way.—*Pharmaceutical Journal*, Vol. III. p. 188.

RICE STRAW is used in China for paper making, and in Europe serves to make straw plat^s for women's bonnets. In China the ashes of rice straw are used as an alkaline remedy in urinary and febrile affections.—*Hogg's Vegetable Kingdom*, p. 816.

RICE WINE, rice beer, and rice spirits are vinous and spirituous fluids manufactured from rice. In the Himalaya, both a beer and a wine are made. In Kulla, Lahoul, and in the Sutlej valley, a kind of beer, and in Nepal a spirit, is distilled from the grain, also a beverage called 'phaur' very much resem-

bling ale, and procured in the same manner. In the S. of the peninsula, in the preparation of arrack spirit, rice forms an ingredient.

The Lau spirit of the Burmans and Siamese is prepared from rice.

In Java, two spirits are prepared from it. One of these, called "badek," is made by first boiling and stewing the rice with a ferment called razi, consisting of onions, black pepper and capsicum, and mixing and forming the whole into small cakes which are daily sold in the markets. After frequent stirring, the mixture is rolled into balls, which are piled upon each other over a high earthen vessel, and when fermentation has commenced, the badek exudes and is collected at the bottom. The remainder, after fermentation is completed, is sold as a dainty in the markets under the name of Tafe. The other rice spirit is called Brom and is made from Retan or glutinous rice and is of a brown, yellow or red colour according to the colour of the rice used. This is boiled in large quantities, and being stirred with 'razi,' remains exposed in open tubs until fermentation takes place when the liquor is poured into close earthen vessels. It is generally buried for several months in the earth, by which means the fermentation is checked and the strength of the liquor increased. It is sometimes made stronger by boiling.

The *Saki* of the Japanese, is a beer which a little resembles wine. It is of an unpleasant taste, but it is drunk at every meal and sold at all the taverns. Before use, it is warmed in a tea kettle and drank warm out of flat lacquered ware cups. It intoxicates rapidly, but the inebriation speedily vanishes, leaving behind a disagreeable head-ache.

The Chinese prepare, from rice, different sorts of wines, of a red, white, yellow or pale colour. The best called Mandarin wine, is strong and will keep for many years. It is wholesome, but expensive, and is only used by the higher classes. Some of the rice wines are highly perfumed. A strong spirit like brandy is distilled from the lees and is called Sam-su and Shou-chu.—*Dr. Stewart, Punjab Plants. Hogg's Vegetable Kingdom*, p. 816. *Dr. Smith's Materia Medica of China*, p. 186.

RICH. HIND. *Viburnum foetens*.

RICH, Claudius James, British Resident at Baghdad, born 28th March 1787, near Dijon in Burgundie, died of cholera at Shiraz on the 5th October 1821. He was British resident at Baghdad from 1806 till his death. His remains were interred without the city walls; but to the eternal disgrace of the prince Houssain Ali mirza, the Persians could not allow them to repose undisturbed, and in 1826, the envoy to the Persian court removed them to the Armenian burying-ground

at Ispahan. He travelled in Kurdistan. He was the first to engage in a series of examinations of the ruins within the limits of ancient Assyria: The remains near Hillah, in the immediate vicinity of Baghdad, first engaged his attention. His discoveries amongst the ruins of Babylon were of considerable interest, though, in results far behind what has recently been published. They consisted chiefly of fragments of inscriptions, bricks, engraved stones, and a coffin of wood; but the careful account which he drew up of the site of the ruins was of greater value, and has formed the ground-work of all subsequent inquiries into the topography of Babylon. The results of his examination and researches at Hillah and Babylon with an able dissertation in the topography of ancient Babylon, and the position of its principal buildings, appeared at Vienna, in an oriental literary journal called the "Mines de l'Orient." This memoir was translated and published in England, and was followed by a second memoir, called forth by some remarks in the "Archæologia," by Major Rennell. The two have since been published in a work containing a narrative of a journey to Babylon, edited by his widow.—*Mignan's Travels*, p. 90. *Layard's Nineveh*, Vol. I. p. xxii to xxiii.

RICHARDSON, Captain David Lester, was Principal of the Hindoo College at Calcutta, The productions of this gentleman were honoured with the praise of Macaulay and his memory was long cherished by his pupils.—*Tr. of Hind. Vol. I. p. XIX.*

There is a Sanscrit proverb, in the first book of the Hitopadesa, which says, "that where there are no trees, even the castor oil plant ranks as forest tree." It grows, however, sufficiently large to produce specimens of wood, but is chiefly remarkable for the beauty of its large spreading leaves, and the value of its seeds which yield castor oil. Two varieties, one bearing small and the other large seeds, are produced all over India. The small seeded variety yields the best product, and is employed in preparing the oil exported for medicinal purposes.

The fresh seeds of the castor oil plant, after having been sifted and cleaned from dust stones, and all extraneous matters, and slightly crushed between two rollers, freed by hand from husk and coloured grains, are enclosed in clean gunny. They then receive a slight pressure in an oblong mould which gives a uniform shape and density to the packet of seed. The

Bricks" as they are technically called, are then placed alternately with plates of sheet iron in water, in the ordinary screw or hydraulic press. The oil thus procured is received in clean tin pans, and water, in the proportion of a pint to a gallon of oil, being added, the whole is boiled until the water has evaporated, the mucilage will be found to have subsided and encrusted the bottom of the pan, whilst the albumen solidified by the heat, forms a white layer between the oil and the water. Great care must be taken in removing the pan from the fire, the instant the whole of the water has evaporated, which may be known by the bubbles having ceased; for, if allowed to remain longer, the oil which has hitherto been of the temperature of boiling water or 212° suddenly rises to that of oil or nearly 600° thereby heightening the color and communicating an empyreumatic taste and odour. The oil is then filtered through blanket, flannel, or American drill, and put into cans for exportation. It is usually of a light straw colour, sometimes approaching to a greenish tinge. The cleaned seeds yield from 47 to 50 per cent. of oil worth in England from 4d. to 5d. per lb. The following is the result of experiments made at Madras and

Calcutta, January 27th, 1858, to ascertain the per-centage of oil in the Castor oil seed.

Calcutta.—1,400 lbs. of seed yield 980 lbs. of kernels and 488 lbs. of raw oil as follows:—

1st sort...Kernels.	632lbs....	Oil....	324 lbs.
2nd sort .. "	184lbs....	"	87½ lbs.
3rd sort.... "	184lbs....	"	76½ lbs.

Madras.—1,400 lbs. of seed yield 480 lbs. raw oil as follows:—

1st sort.....	318 lbs. of oil.
2nd sort.....	88 lbs. do.
3rd sort.....	74 lbs. do.

The cost of the Madras oil was Rs. 76-1-0

viz:—

1,409 lbs. seed at Rs. 3-3 per bag of	
164 lbs.	27 3 4
Husking, selecting kernels, cooly hire....	3 11 9
Crushing, moulding, pressing, and boiling.	2 7 1
Filtering and sundries.	2 8 0
Overseer's pay, Godown rent, &c. &c.	1 6 2
300 empty quart bottles, corks, &c.	34 4 8
Cleaning and Packing charges.	4 8 0

Or an average of annas $4\frac{1}{2}$ per quart of first, second and third sort oil = 4d. per lb.

This oil is chiefly used as a mild purgative. Soap of good quality may be made of it, but the cost and disagreeable smell which it communicates, preclude its general use. The Exports, from Madras, for the 4 years 1849-50 to 1852-53, averaged 11,325 galls. per annum. The clearness, limpidness and absence of any offensive smell, are qualities that do not arise from any superiority of the seed, or care in extraction, but from repeated decolorization with animal charcoal, and exposure to the sun's rays which in the opinion of many eminent medical men, considerably detracts from its strength and efficacy. When manufactured in the ordinary native mill, this pure oil is sometimes used by the richer classes in lamps. Castor oil extracted hot differs from the preceding only in the mode of preparation—The seeds are boiled for two hours in water, dried for three days in the sun, freed from the shells, pounded and then boiled in fresh water, until the whole of the oil has risen to the surface. Five seers of the seeds or $13\frac{1}{2}$ lb. should by this process yield a quart of oil. This is the sort generally used in medicine by native practitioners, it is straw-colored, and free from any unpleasant taste or smell.

Castor oil, or lamp oil, Fructibus majoribus.

Vidlak ennai ...	TAM.	Chiragh-ka-tel...	HIND.
Ped amidum	TEL.		

This oil which is obtained from the large seeded variety of the *Ricinus communis*, is sometimes drawn cold, and a straw-colored specimen scarcely distinguishable in quality from the oil of the small seeded variety was shown by Lieut. Hawkes. It is, however, more usually extracted by heat, and forms the common "lamp oil" of the bazaar. The seeds, having been partially roasted over a charcoal

fire, both to coagulate the albumen and to liquify the oil, are then pounded and boiled in water until the oil rises to the surface. The roasting process, however, gives it a deep red colour and an empyreumatic odour. The price of this oil varies in different parts of the country from Rs. 1-10-0 to Rs. 3-13 6 per maund of 25lbs. The average of nineteen large stations, in all parts of the Madras Presidency for the Quarter ending 31st October 1854 was Rs. 2-3 6 per maund. It is used chiefly for lamps.

The average Exports from Madras for six years is 27, 561 gallons per annum.—*Lt. Hawkes, M. E. J. R. Dr. Cleghorn in Powell's Hand-Book for the Punjab.* See Castor Oil.

RICINUS DICOCCUS, Roxb.

Taw-the-din-bin...BURM.

This tree grows in Amboyna and in British Burmah, but it is scarce and found only on the banks of streams in the Pegu and Tonghoo districts. It yields a very tall large timber. The wood is red and adapted to cabinet making.—*Drs. Voigt. McClelland.*

RICINUS TANARIUS.

Ubar.....MALAY.

A tree of Sumatra. Sails and nets are dyed, and perhaps also tanned, with its wood. The mordants used are rice-bran, alkalis from the combustion of some vegetable matters, as the fruit stalks and mid-ribs of the cocoanut palm, and alum brought from China.

RICSHA, SANS., a bear. In hindu astronomy the general term for a constellation, Maha-Ricsha may therefore be understood either as the constellation of the great bear; or as the great constellation. Whether the former denomination (which is the same as the name given by Europeans to the asterism called the Great Bear) be merely accidental; or whether by that term, both Europeans and Hindus mean the same object, is uncertain.—*Edward Warren Kala Sanhita.* See Nacshatra.

RIFF, a race on this N. W. coast of Africa. See Semitic races.

RIGAS ISLANDS; these are Pulo Roosum, Pulo Engaling, Pulo Samote, Pulo Poogalise and Ojong Battoo Tootung, off the coast of Sumatra. Rigas Hill or Booket Qually, is one of the best marks on the coast of Sumatra.

RIGHT HAND CASTES.

Dakshina-Bhakta, HIND. SANS	Tengale. TAM. TEL.
Sidha Hat'h.	

In South India, a sectarian division amongst the vaishnava hindus, much animosity and quarrels occurring between the two sects styled the right and left-hand, the tengali and edagai, the causes of which or the points of difference the disputants themselves are generally unable to state. Professor Wilson tells us that when

the worship of any goddess is performed in a public manner, and agreeably to the Vaidik or Pauranik ritual, it does not comprehend the impure practices which are attributed to a different division of the adorers of sakti, and which are particularly prescribed to the followers of that system. In this form it is termed the Dakshina or right hand form of worship, to distinguish it from the Vami or Vamachari, the left hand worshippers or those who adopt a ritual contrary to that which is usual, and to what, indeed, they dare publicly avow. They worship Devi, Lakshmi, Saraswati, the Matri, the Nayika, the Yogini, and even the fiend-like Dakini and Sakini, are admitted to a share of homage. Siva with the two hands, is an object of veneration, especially in the form of Bhairava, with which modification of the deity it is the object of the worshipper to identify himself. The worship of the Vama-chari, is derived from a portion of the Tantra. It resolves itself into various subjects, apparently into different sects, of which that of the Kaula or Kulina is declared to be pre-eminent. The object of the worship, is, by the reverence of Devi or Sakti, who is the female power of Siva, to obtain supernatural powers in this life, and to be identified after death with Siva and Sakti. All the forms of worship require the use of some or all of the five Makara, Mansa, Matsya, flesh, fish, wine, women and wine are the five-fold Makara, which take away all sin.

The distinction of right and left hand castes is peculiar to the south of India. It is supposed by Professor Wilson to be of modern origin, and to have been introduced at Conjeveram, as a part of civil policy to divide the people and undermine their powers. But sir Walter Elliot is of opinion that the separation into right and left hand castes had its origin in the violent conversion of the ancient races from buddhism to hinduism, and he has been shown a figure of Budha, which the artizan caste worship. At present they seem to worship Viswakarma, but the bulk seem to recognize Siva as their supreme deity. And in the year 1872, the figure worshipped by the goldsmiths of Madras is called Samunday-Isvara, and his pictures represent a green coloured man with four hands seated on a lion, one paw of which has struck down a dark coloured warrior armed with a sword and shield. The god has a munga cap; he has a long trident supported between his breast and arm; in one hand he holds a lotus flower, in another a chank shell, and the other two hands are in the position usually given to those of the figures of Vishnu and Gaudama, when preaching.

The artizans all bury their dead in a sitting posture, like that of Budha sitting, with the head

of the dead close to the surface and looking to the north and their dislike to the brahmins is intense. Caste, has in the Peninsula, certainly nothing to do with religion, but relates solely to race. It is amongst the Tamil people that the right and left hand sections appear. The Idan-kai or Idan-gai, are the left hand caste, and the Valan-gai are the right hand caste. According to Professor Wilson, the names and appellations of right hand castes vary in different parts of peninsular India, but are usually supposed to be eighteen in number, viz.

Banijaga or trader.

Okhalaga or cultivator.

Jotiphana or oilmaker, employing one bullock.

Rangajiva, dyer or calico printer.

Ladaru, mahomedan traders and artificers.

Gujerati, bankers from Guzerat.

Komati, merchant shopkeepers of the Vaisya. Jaina, Jains.

Kurubar, shepherd.

Kumhar, potter.

Agasa, washerman.

Besta, fishermen, employed as palanquin bearers.

Padma Shalaysa, weaver.

Naindu, barber.

Upparavu, tank digger.

Chitragara, painter.

Golla, cowherd.

Wallia, or Pareyan, or Paria, who is the champion for the right hand caste, as is the Madaga or Sakoli that for the left hand caste.

Of the left hand castes,

RIG-VEDA. is SANS. from rich, an incantation, and Veda, from vid, knowledge.

RIG VEDA SANHITA. A collection of ancient hindu hymns which were translated from the Sanscrit by Professor H. H. Wil-

son, in 1850 to 1857, and into French by M. Langlois in 1851. The Rig-Veda contains no mention of Rama and Krishna.

RIG-VEDA SANHITA, is a collection of ancient hindu hymns, constituting the fifth to eighth Ashtaka, or books of the Rig-Veda, the oldest authority for the religious and social institutions of the hindus. The Atharvana, the last of these, evidently belongs to a much later age than the rest. The hymns of the Rich or Rig Veda are repeated entirely in a disjointed form in the Sama, and, with little alterations, in the Atharva, also. The Yejur Veda contains principally forms of prayer. A Veda in its strict sense, is simply a *sanhita* or collection of hymns. These hymns form the mantra or ritual, and are the true Veda. The Rig, the Sama, and the Yejur are the three universally received. The Atharvana is of more doubtful authenticity. They comprise various sections, which are again divided and sub-divided under the distinctions of Mantra, Brahmana, It'hihasa, Purana, Upanishad, &c. They were reduced to order by Vyasa, and prescribe the moral and religious duties of mankind. But the books on divine knowledge called Veda, or what is known, and Sruti, or what has been heard from revelation, are supposed to have been very numerous; and the four here mentioned are thought to have been selected as containing all the information necessary for man. The commentaries on these hindu scriptures, among which that of Vasishta seems to be reputed the most excellent, are innumerable. From the Vedas are immediately deduced the practical arts of chirurgery and medicine, music and dancing; archery, which comprises the whole art of war; and architecture, under which the system of mechanical arts is included. The Rig-Veda Sanhita is the oldest book known to the hindoos and certainly one of the oldest books in the world. Each hymn is called a Sakta, of which there are about a thousand, arranged into eight Ashtaka or Khanda, of unequal extent. Another division is into ten Mandala, subdivided into a hundred Anuvaka. Each hymn has a Rishi or inspired writer for its author. The deities which the Rig-Veda invoke, are elemental, i. e., personifications of earth, fire, and water and the winds, &c. In the 3rd Ashtaka, Agni, has 44 hymns addressed to him; the next to him in number, comes Indra, with 48, and after them, the Marut or the winds have the largest number of hymns. The Rig-Veda is only one, though the chief, of the four Vedas, the others, the Sama Veda, Yejur-Veda and the Atharvana Veda, come after it. These four form the Sanhita or text. The Sanhita itself with the hymns it embo-

dies forms the mantra or ritual. The language of the Vedas is not Sanscrit in the strictest sense of the term, but there is not sufficient difference between it and classical Sanscrit, to authorize its being called a separate language. The difference is not so great as between Anglo-Saxon and modern English, but it is greater than between Homer's and Demosthenes' Greek. The names of the Rishi or composers are not always given in the body of the hymns and there is nothing to guide the historian or chronologist as to their dates. Nevertheless, good scholars are of opinion that Vedic hymns were composed mostly about fifteen or seventeen centuries before Christ, but not committed to writing, and therefore not collected until the eighth century B. C. With all their difficulties they furnish much information regarding the origin and early state of some of the races who are now called Hindus. Portions of the Rig-Veda have been translated by the late F. Rosen, the late M. Langlois, Professor Wilson, and Dr. Muller whose 3,000 pages of large quarto embraced little more than half the Sanhita with Sayanas' Commentary. Roth calculated that the mere Sanhita or metrical portion of the Vedas, as distinguished from the Brahmana or later ritual appended to each, contains not less than 30,000 couplets, of which 11,000 go to the Rig-Veda.

The *Brahmana* are sanscrit prose works, of later date than the Veda, the oldest is the Athareya, which has much historical information. The several Brahmana are chiefly liturgical and legendary, and in the various Upanishad, passing into the rationalized state, and becoming metaphysical and mystical. It would be difficult to find two sets of opinions more absolutely irreconcilable than Vedic hymns and Vedantic philosophy. The Sutra (aphorisms) or Brahma sutra, the chief authorities of the pantheistic Vedanta school, though much later than the rest, are still neumonic, as also is the Vaiseshka or atomic school of Kanada. This supplementary mass of Vedic literature including philosophy, commentaries, aphorisms, &c., might furnish occupation for a long and laborious life.

A striking difference has been observed between the mythology of the Rig Veda, and that of the heroic poems and Purana. Some of the divinities worshipped in Vedic times, are not unknown to later systems, but at first perform very subordinate parts, whilst those deities who are the principal objects of worship of the present day, are either wholly unnamed in the Veda, or are noticed in an inferior or different capacity. The names of Siva, of Mahaveda, of Durga, of Kali, of Rama, or of Krishna, so far as research has gone, do not

occur in the Vedas. The practice of the conquered races seems to have been to represent or regard their local deities as identical with avatars or incarnations of the Vedic chiefs who had already become objects of worship. The Vedas mention Rudra, as the chief of the winds, collecting the clouds as a shepherd's dog does the sheep, and attending on his master Indra. The most that can be made of Rudra in the Vedas is as the father of the winds and seemingly a form either of Agni or of Indra. Even in the Puranas he is of a very doubtful origin and identification, but in the present day, everywhere amongst the hindus, he is identified with Siva. With the single exception of an epithet 'Kapardi,' with braided hair, of doubtful significance, and applied also to another divinity, no other applicable to Siva occurs, and there is not the slightest allusion to the form in which, for the last ten centuries at least, he seems to have been almost exclusively worshipped in India, that of the lingam or phallus: neither is there the slightest hint of another important feature of later hinduism, the trimurti or triune combination of Brahma, Vishnu and Maheswara or Siva, as typified by the mystical syllable O M, (a-u-m), although, according to high authority on the religions of antiquity (Creuzer, Vol. I, pp. 26 & 27) the trimurti was the first element in the faith of the hindus and the second was the lingam. In this view Creuzer must have imagined the existence of a mixture of the creeds still distinct in India; for the whole vedic faith had few of the elements of modern hinduism.

The Institutes of Menu, is a work composed eight centuries before the Christian era, but the Rig Veda is of still higher antiquity. The first institution of hindoo society which now forces itself upon the attention of the stranger, is that of caste. When Mr. Borradaile counted the castes in Surat in A. D. 1827, he found 207 in that city. Each of them was more or less restricted from private intercourse with all the rest; they could not intermarry, nor even eat the same food, nor drink the same water. The date of the origin of caste, and the objects in view are alike obscure. Bunsen (p. 589) says the system of caste seems to have become completely formed B. C. 3000, during the formation of the kingdom of the Puru and the system of caste was in full force when the Code of Menu was composed. In the Vedic hymns, nothing appears of a priesthood, properly so called. In some, brahmins officiate, but are evidently subject to the Kshatriya as chaplains to the noblemen. Their allusion to castes is very vague, as when the five classes of beings are mentioned, which may mean the four castes of the Aryan, race and a fifth of the barbarians. But there is one hymn in

the Veda, known as the Purusha Sukta, which represents the brahman as superior: though it does not correspond with the legend on that subject in its later form. It is given as follows in Mr. Muir's Sanscrit text (p. 7) and is a mystical description of existences from an original being, under the similitude of a sacrifice or as a mental sacrifice. (ver. 7.) This victim Purusha, born primevally, they immolated on the sacrificial grass: with him as their oblation, the gods, the sadhya, and the rishi sacrificed. 8. From that universal oblation were produced curds and clarified butter. He produced the animals, of which Vaya is the deity, both wild and tame. 9. From that universal sacrifice were produced the hymns called Rich and Saman, the Metres, and the Yajur. 10. From that were produced horses and all animals having two rows of teeth, cows, goats and sheep. 11. When (or offered up) Purusha, into how many parts did they divide him? What was his mouth? What were his arms? What were called his eyes and feet? 12. The Brahman was his mouth, the Rajanya was made his arms; that which was the Vesya was his thighs; the Sudra sprang from his feet. 13. The moon was produced from his mind (Manas); the sun from his eye; Sudra and Agni from his mouth; and Vaya from his breath. 14. From his name came the atmosphere; from his head the sky; from his feet the earth; from his ear the four quarters, so they formed the worlds. The comparatively late date of this hymn, is evident from the mention of the Sama and Yajur Veda (ver. 9) but it is older than other accounts which are given in Menu and the Mahabharata, when the mystical significance of the story disappears, and the castes are represented as literally proceeding from Brahma's body. Even when this origin of the castes had been received, and the supremacy of the brahmins established, it was still considered possible to rise by means of mortification from the Kshatriya to the Brahmanical caste. The fact of Visvamitra and other of the Kshatriya having been inspired by Rishi, to whom some of the hymns of the Rig Veda had been revealed, was so stubborn, that the brahmins even after this ascendancy could only parry its force by accounting for it in their own way. Sir Henry Elliot says that about the sixth and seventh century, the divisions of castes were secular, not religious. In former times, he says, the four classes existed, equally amongst the budhist and hindu of India, as they do at this day amongst the budhists of Ceylon, and amongst the Jains of the peninsula, in whose temples even brahman priests may be found officiating (Elliot's Hist. of India) with the persons of almost every separate calling. At the

present day, however, the brahman, the Kshatryi, the Vaisya, the Sudra, the tradesmen and artisans of India are mostly all associated in classes or sects or castes, who do not intermarry, and seldom eat with others. Amongst these, may be named the Banjara, or wandering grain merchant; the Bhattlari or cook; Chichri or scavenger; the Dhor or currier and leather worker; Dhangar or shepherd; Erkalvadu or basket maker; Gaoli or dairyman; Kalaigar or tinner; Kassar or brazier; Khanjar or poulterer; Ladaf or cotton seller; Lar-kassai or beef salesman; Lal begi or scavenger Lohar or blacksmith; Mookre or mealman Muchi, leatherworker; Rangrez or dyer; Saikalgar or cutler; and Sonar or goldsmith.

In the south of India, the five artisan classes are called Kammalan, Kamalar, Kansalar or Comsalar, and Professor Wilson thinks the word Comsalar may be derived from the Sanscrit and Hindi Kans, Bengali Kansa, a mixed metal. In Madras the artisans of the Tamil race are of the five left-hand castes, the Kansala being the goldsmith, chief of the five left hand castes; the other four are the kanchari or brazier, kamhari or blacksmith, tatchan or carpenter, and kasi or stone mason. These five intermarry and eat together, and all wear the zonar, or sacred cord.

The hindu races, who profess some part or other of the brahminical creeds, are kept apart from each other by the castes, to which their various origins have given rise, but their sectarian religious views are now also sources of caste. In the physiological worship of the hindus for instance, while one class of sectarians, the saivava and the lingaet, worship the form of the lingam, another set of sectarians, the sakta, worship the yoni, in accordance with the doctrine of the Tantra. The sakta are divided into two classes, the Dakshinachari, or right hand Sakta, and the Vama-chara, or left hand Sakta. The right hand worship is public, and addressed to the goddesses usually adored, but especially to the forms of Durga, Bhawani and Parvati, also to Lakshmi, and others. But in the worship of the left hand divisions, the Tantrika impersonations of Durga as Devi, Kali, Syama, &c., or a living woman representing the Sakta, the worship is private and impure, and is said to have the most numerous followers, but this is unknown in the peninsula of India. The Vira Saiva, who are known as the jungam, also as the Lingaet or Linghadari, from wearing, always, the lingam and who are very numerous in the Canarese speaking tract, ought not, according to the tenets of their sect, to have any caste distinctions; but they are the most bigoted of all the hindu sects, and their caste distinctions are those of trade and avocation, and are rigidly

adhered to. Among the Jains, whose religion consists principally in the practice of austerities, and in avoiding to destroy life, caste restrictions are not prescribed, nevertheless they too retain the practice of caste divisions and the Sarawuk practice many usages common to other hindoos. If a Jain come into contact with an outcast, he, like the hindoo, touches fire or water to purify himself; if he have occasion to receive any thing from a pariah, he, like a hindoo, causes to set it down on the ground, and purifies it with fire or water, before he takes it up. Even shepherds and Koolies incur pollution by touching the dher race, which they remove in a similar manner. In the course of evidence before a criminal court in Goozerat, in August 1853, "two shepherds, Bhugwen and Rodo," stated a Koolie, "came to me, and said they had both touched dhera, and became impure, and asked me to give them fire. I took a lighted coal out of my hookah, and each of them touched his forehead with it. I threw it down, and they then took my hookah, and smoked." In other words, they were then purified, otherwise he could not have given them his hookah. If a sudra hindoo ask a drink of a brahmin, it will be given in a brass vessel, but from a distance,—the brahmin stretching forward and placing the pot between; it is returned similarly, but before receiving it back, water is poured over to purify it. No one of the helot races can enter the house of a hindoo, but he will stand at a distance and shout out his message. These all are illustrations of the usual operation of caste in India, which has held its own in the religious, social and political changes of 3,000 years. Since railway trains and steam boats have been running, and the educational system of the British has equalized all classes, much of the dread of caste defilement has disappeared, but it is still the prominent feature in everyday hindoo life. *Forbes' Ras-Mala or Hindoo Annals, Vol II., 237-38. Wilson's Glossary. Elliott's Supplemental Glossary.*—See Arians; Hindu; Inscriptions; India; Kakshivat; Kasyapa; Vedas; Vidya.

RIGYAJUSHSAMAT'HARVA. See Vidya.

RIGYAL, TIBETAN, lit. mountain king, is the origin of Plutarch's Mount Argillos (De Fluviis), the name of the mountain on which Bacchus was born. Riga, Tibetan, a mountain, is the same term as mount Righi, in Switzerland. Rigyal is one of the Trans-Himalayan range. The peaks of this range are from 20,786 to 21,000 feet in height. Its general direction is from south-east to north-west, and its extreme length is upwards of 850 miles. It forms the natural boundary of Ladak, Balti, and Rongdo, on the north, and

Bukchu, Parik, Dras and Astor on the south. Its passes on the eastern half of the range are from 16,495 to 18,746 feet in height, and on the western half, from 12,000 to 16,000.

RINCHOR, from rin the field of battle, chor, from chorna, to abandon. Hence Rinchor, one of the titles under which Krishna is worshipped at Dwarica, is most unpropitious to the martial Rajpoot. Kal-Yamun, the foe from whom he fled, and who is figured as a serpent, is doubtless the Tak, the ancient foe of the Yadu, who slew Janmeja, emperor of the Pandu.

RIN-COOND is the 'fountain of battle,' and pani or ab is applied, as we use the word water, to the temper or spirit of a sword:—*Tod's Rajasthan*, Vol. I., p. 523.—See *Krishna*.

RIND, a river near Chachendee in Cawnpore.

RIND. A tribe who reside in Kutch Gundava, a district or section of Baluchistan, on the east of which, is the capital, Gundava. It is a great level tract, inhabited by three very distinctly marked races, the Jet or Jat, the Rind including the Maghazzi, and the Brahui. The Jet seem the original race, and they occupy the centre of the province. The Rind with their lawless sub-tribes, the Jakrani, Dumbaki, Bughti and Marri, are a more recent intrusive race dwelling on the skirts. The Doda, a division of the widely dispersed great Marri tribe, have, for the last three centuries, occupied the hill ranges east of the plain of Kachi. The Marri are a brave race, and have long been distinguished as daring depre-

dators. Harand and Dajil, in Kach Gandava, but bordering on the Indus, are inhabited by the Gurchani tribe of Rind, and have the Mazuri on their south. The Great Rind tribes are subdivided into 44 branches, and though not Brahui are denominated Baluch. Their traditions affirm them to have immigrated ages ago, from Damascus and Aleppo. Their language is the Jetki in common with that of the other inhabitants of Kach Gandhava and Mard-i-Rind means a brave man. The Rind of Kach Gandava are of the Utan Zye division:

Utan Zye dwell at Suran.

Dumbki and Jakrani dwell at Lehri.

Doda Marri dwell at Kahan.

Bughti dwell at the hills east of Lehrat, Sing-Saloh and Teriki.

Homarari dwell at Tambu.

Jamali dwell at Rojan.

Of these Rind tribes, the Dumbki, Jakrani, Bughti and Doda Marri, had always been distinguished by their rebellious and predatory habits. They indulged these in the attacks on the British armies west of the Indus. The Marri tribe is considerable and inhabit the eastern hills of Kach Gandava, and a peaceful and obedient portion of the tribe are in the hills west of the province below Jell. A large portion are at Adam Marri, on the S. E. frontier of Sind. The Marri of Kach Gandava were notorious for their lawless habits and for making frequent inroads on the plains. They and the Maghazzi seem to have emigrated from Mekran to Kutch Gandava at different periods, and to have become incorporated with the Jut cultivators.

The following minor Rind tribes reside in the north-eastern hills of Saharawan.

Kallui at Lup. Mandarari at Rodbar,

Kuchik at Kirta. Pugh at Kajuri.

Puskli at Johan.

The Rind form two great tribes on the western banks of the Indus, the Gurchani inhabit Harand and south of these are the predatory, but nearly independent, Mazari tribe. The Maghazzi are the deadly enemies of the Rind, but are probably of the same race. The Maghazzi are subdivided into four principal families or clans, of which the Butani of Jell are the most illustrious and give the chief or sirdar, to the whole. They boast of being able to muster 2,000 fighting men, and between them and the Rind a blood feud long existed. The Maghazzi and Rind are alike addicted to the use of ardent spirits, opium and bhang.—See *Beluchistan*; *India*; *Kajik*; *Kelat*; *Jell*; *Jutt*.

Rings are used in Eastern and Southern Asia, as signet rings, with a seal engraved, or for ornament, worn on the fingers, toes, wrists, ankles or in the nose, and ears. A ring is not used as a marriage token, as in Europe, though amongst all nations and in every age, the ring has been chosen as the aptest emblem of time, and such names as "*annus*;" *ἔτος, ἔτος, eviauros*, and year from *ya* to surround, mark the most recurrent period known to men.

RIO JANEIRO, a town in Brazil, in South America, so named by its discoverer DeSouza. The inhabitants are principally of a mixed descent. The Brazilian diamond mines were first discovered in 1728, in the district of Serra de Prio, to the north of Rio de Janeiro. The largest diamonds are procured on the river Jequitinhonha, which is called the Diamond River, also Rio Pardo. In the Ural mountains, diamonds were detected in 1829, by Humboldt and Rose, in their journey into Siberia. In the United States the diamond has been met with in Rutherford country, North Carolina, and in Hale country, Georgia; they have been found on the river Ginul, in the province of Constantine, in Africa also north of Cape Town. They have also been discovered in Australia, and of such size as to render it probable they may add yet more to the mineral treasures of that country. The rocks in which the diamond occurs in Brazil are either a ferruginous quartzose conglomerate, or a laminated granular quartz called Itacolumite. The latter rock occurs in the Urals, and diamonds have been found in it; and it is also abundant in Georgia and North Carolina. In India, the rock is a quartzose conglomerate. In most instances diamonds are obtained from alluvial washings. In Brazil the sands and pebbles of the diamond streams are collected and washed under a shed by a stream of water passing through a succession of boxes.

RISH BARGAD.—? *Ficus Indica*.

RISHI. A priesthood of mahomedans in Kashmir, who do not marry and who abstain from flesh.

RISHI. An important term in hindu astronomy, which, in its scientific sense, means a line, or great circle, passing through the Poles of the Ecliptic and the beginning of the first Solar sidereal sign, and first fixed Lunar mansion, of the respective zodiacs; and which said circle is supposed to cut some of the stars in the Great Bear, which most commentators take to be Dhube, or β Ursæ Majoris, and ζ Piscium, although in reality no such circle could be made to intersect exactly these three points. This line, or circle, being thus invariably fixed, and the four (fixed and moveable) zodiacs conceived to coincide at a particular epoch, the variation of the moveable ones may easily be reckoned by its means, as if it were an index. Thus, suppose that the line of the Rishi should have intersected the beginning of the fixed Lunar mansion Magha, as was supposed to be the case in the 1910th year of the Caliyug (1192 before Christ), and that at the beginning of the said year the line of the Rishi was found by observation to intersect the middle of the moveable mansion Magha, then it would be said truly that the Rishis had got into $6^{\circ} 40'$ ($13^{\circ} 20'$) of the moveable Magha, and these $6^{\circ} 40'$ would mark the absolute precessional variation which had accumulated at that epoch since the time that the fixed and moveable Maghas coincided; (vide Ayana, Ayanansa, Cranti-Pata-Gati).—The above explanation of the term Rishi is clearly justified by all the hindu treatises of any weight which have hitherto fallen into the hands of Europeans; and here it may not be out of the purpose to observe, that when Hipparchus (later than the 135th year before Christ) on comparing his observations of Spicæ Virginis (the Harshasa of the Indians) with those that Simocharis had made at Alexandria about a century before, and perceived by the results, that the Stars appeared

to have advanced (though slowly) from west to east, relatively to the equinoctial points, he was far from imagining that Indian astronomers (perhaps several centuries before his time, and in all probability by observations of the same star) had already noticed the same variation, on which, in after ages, Sir Isaac Newton resolved and established the great problem of the equinoctial precession. The celebrated Indian astronomer Aryabhatta, probably puzzled how to account for the change of the position of the line of the Rishis, which, he admitted, had intersected the middle of the moveable Lunar mansion Magha in the year of the Caliyug 1910 and which he pretended to cut (when he wrote) the beginning of Aswini, imagined a curious system on the seven stars of the Great Bear, to which he supposed a proper motion to the eastward, at the rate of $13^{\circ} 20'$ (a Lunar mansion) in 100 years; which amounted to 159,999 revolutions in a Calpa, and which squared his account. But this absurd doctrine has long since been abandoned by all manner of Indian astronomers; many of whom, in existence, in 1810, had never heard of it. — *Warren, Kala Sankalita* p. 85, 245.

RISHI is also applied (in a sense totally different) to the Vanaprastha brahmins, or inhabitants of the desert. Of these the most ancient and celebrated were the seven great Rishi, or penitents, or Maha Saptaita Rishi astadha, who had retired in the territory washed by the Indus; and it was to them, it is supposed, that Alexander the Great applied for instruction after invading their country.

A brahman who keeps the sacrificial fire is obliged by law to know the particular gotra of the 491 to which his own family belongs. When the fire is to be consecrated, Agni Havyavahana, the god who carries the libations to heaven, must be invoked. This invocation or invitation of Agni is called pravara. Agni himself or the fire, is called Arsheya, the offspring of the Rishi, because the Rishi first lighted him (it) at their sacrifices. He is the hotri as well as the adhvaryu among the gods. Like the hotri and adhvaryu priests, he is supposed to invite the gods to the sacrifice and himself to carry the oblation to the seat of the immortals. When, therefore, a brahman has his own fire consecrated, he wishes to declare that he is as worthy as his ancestors to offer sacrifices, and he invites Agni to carry his oblation to the gods as he did for his ancestors. The Rishi saints belonged to the Vedic age. They are sages or seers, to whom was attributed the authorship of the hymns in the Vedas. In hindu mythology, the Rishi, were the children of the Menu, the offspring of the Brah-

madica, who were the sons of Brahma. They are seven in number, and are named Kasyapa, Atri, Vasishtha, Viswamitra, Gautama, Jamadagni, and Bharadwaja. They are, astronomically, the husbands of the six Pleiads, but how six and seven can accord, it may be difficult to understand, yet they have had the honor of becoming the seven bright stars in the Great Bear; and they are fabled to be married to the Pleiades. Viswamitra was formerly a king and son of Gathi and by his devotion he became a Rishi and capable of creating as well as Brahma. See Arian; Brahmadica, Caste; Hindoo; Lords of created beings; India; Manu; Meru; Polyandry; Rama; Sati; Varaha; Veda, Uma. — *Muller, Coleman's Myth. Hind.* p. 9. *Moor.* p. 86.

All the principal rivers of South Eastern Asia flow into the Persian Gulf, the Arabian Sea, the Indian Ocean, the Bay of Bengal, and the Pacific Ocean. The watershed of the Bay of Bengal includes the Ganges, Brahmaputra, Mahanuddy, Godavery, Kishna, Pennar, Cauvery, &c. The watershed of the Arabian Sea includes the rivers Indus, Lunee, Nerbudda, Tapti, and the numerous torrents descending from the Western Ghats. The Himalayan watershed has invariably been found to lie at a very considerable distance to the north of the great Himalayan peaks which, from the side of Hindustan, seem to form the watershed. This peculiarity has been confirmed by the routes of A. Zaskari. The Himalaya gives forth four great rivers, the Brahmaputra, Indus, Sutlej and Kurnali or Gogra. These are called by the Tibetans, Tam-jan-khamba, or Horse's mouth; Singh-gi-khamba, or Lion's-mouth; Langchan-khamba, or Bull's-mouth and Maba-khamba, or Peacock's mouth. These four great rivers drain the Kailas group of mountains. They rise close to the great Kailas Purbut. A peculiarity in the river system of British India merits notice. It is that shortly after issuing from the mountains among which they rise, the rivers run through low-lying valleys to the sea. Their fall is so gentle that, following their windings for even 1,000 miles from the ocean, the rivers of India are still found running in beds, only seven or eight hundred feet above the level of the sea, thereby affording great facilities for damming up their waters, and for making long reaches fit for navigation. The seas, with the marginal basins of their affluent rivers, are districts of the greatest importance physically as well as ethnographically but the rivers of S. E. Asia are of great importance. The proportional length of course of some of the most noted rivers in the world are shown nearly by the following numbers;—

The Yang-tse-Kiang of China forms, with the Hoangho, a twin basin, to which the most advanced and powerful eastern civilisation owes its development. The Yang-tse-Kiang is connected on the west with the twin basins of the Salwin and Irawadi, which are themselves connected inland with the Tibetan district and on the S. and E. to the Indian oceanic basin. It is undoubtedly one of the finest rivers in the world; it takes its rise in the mountains of Tibet, and, after traversing the Koko-Nor, enters China at the province of Kan-Su; it then leaves it again to water the sandy plains, at the foot of the Alechan mountains, surrounds the country of Ortoous, and after having watered China from south to north, and then from west to east, goes on to throw itself into the Yellow Sea. The waters are pure and; beautiful at their source, and only assume their yellow tint, after passing the Alechan and the Ortoous. The river rises almost always to the level of the country through which it flows; and to this is to be attributed the disastrous inundations which it occasions. These floods, are very so fatal to China, but they are of little consequence to the nomadic Tartars, who have only to strike their tents, and move off elsewhere.

Irawadi. The sources of this great river are, according to the best authorities, between 27° and 28° of north latitude, and the direction of its valley is nearly due north and south. The transverse range, which separates the upper part of the western branch of the Irawadi from the valley of Assam, is of moderate elevation, varying probably between 5,000 and 6,000 feet. The slope of the valley of the Irawadi is greater than that of the Indus or Ganges. The valley of Hukum is said to be 1,000 feet above the level of the sea. The central branch of the Irawadi at Manchi in L. 27° 20' N. is 1,800 feet; at Bhamo in L. 24° about 500 feet. Along its bank, hills frequently approach and some of them close to the river are 3,000 or 4,000 feet high. Amongst the high mountains at its source the rain-fall is considerable; at its centre, the fall of rain is comparatively small but much rain falls at its delta. The valley of Manipur is drained by the westerly tributary of

the Irawadi. Griffith's account of the Irawadi above Bhamo is, that it keeps up its magnificent character, as far as he went, to the mouth of the Mogoung river, where it is 900 to 1,000 yards across, and he describes the appearance of its vast sheet of water as really grand. At the beginning of the first defile, about five miles above Bhamo, the river is about 1,000 yards across, and its course is defined by low wooded hills which run close to its banks. About two miles farther on the channel narrows to 500 yards, and hills become even closer and hang more abruptly over the stream than before, and, about another mile beyond, a higher range of hills from the south-west comes in behind the former one, and both terminate on the bank as head lands. The great Irawady river and the seas in which the Mergui and Eastern Archipelagos are enclosed, abound in fish, and the Malays shoot their great stake nettings far into the ocean. The wealth of these eastern rivers and seas is boundless.

The Burmans, are the predominant people of the basin of the Irawadi, and occupy the lower part of the basin above Pegu, the southern part of the upper basin and the valley of the river beyond, as far as Ba-mo. They are also found in the delta, but their progress there has been comparatively recent, and the prior inhabitants still form the greater majority. Their native name Ma-ran-ma, M'ran-ma, whence their softened modern M'yan-ma, M'ya-ma, is the source of the European corruption Burman. The principal seat of the Burman power appears to have been for the longest periods in the same part of the basin where it now is. In the era of their greatest stability and prosperity, their capital was at Pagan (probably the place of that name above Ava) from the second to the middle of the fourteenth century. Previous to this, on their first advance from Aracan, they appear to have conquered the northern part of the ancient kingdom of the Mon—for their capital was for 395 years at Prome. It was not till the middle of the sixteenth century that they succeeded in annexing Pegu. But in the middle of the eighteenth century, the Mon threw off the yoke and in their turn subjugated all Burmah for a short period. The Burmans differ from the Anamese in being stouter and darker, and in the head being Daya-Polynesian or Turanian oval, and not obtusely ovoid. The head varies greatly and the coarser forms show a tendency to the Binua contraction of the forehead, rendering the lateral expansion of the forehead very marked. The normal, or non-Indianised Burman head, appears, in many respects, to resemble the coarse Sumatran, Javan, Borneon and Polynesian. This softened Turanian type is decidedly

allied to the oblong square and oval Chinese type and not to the ovoid and orbicular type of the Tibetan, some of the Himalaya—Gangetic, the Anam and the Celebesian tribes. The Burmans on the west more often resemble the handsome Asianesian tribes found in Borneo, some parts of East Indonesia, and Polynesia. Burmans and Malays are somewhat stouter than the Siamese, the average height being probably about 5 feet 2 inches. As in buddhist countries, Burmese women are more nearly the companions and not the slaves of the men. But the Tibeto-Burmans and the cognate Indonesian tribes permit great license to both sexes, prior to marriage, when chastity is not required.

From the central axis of the Himalaya, a succession of secondary ranges take their origin which descend on the one hand towards the plains of India and on the other towards the northern rivers. These secondary chains, on the Indian side separate the great rivers which flow towards the plains of India and which, successively uniting in their courses through the plains ultimately discharge their waters into the Indus and Brahmaputra from which they are at first separated by the whole breadth of the Himalaya. The great rivers from west to east in succession are the Jelum, the Chenab, the Ravi, the Beas, the Sutlej, the Jumna, the Ganges, the Gogra, the Gandak, the Cosi, the Tista, the Monas, and the Subansiri. All these are separated by chains at first of great elevation, but which terminate at last abruptly in the plains of India. A deluge of rain falls on the Himalaya, greatest at 6000 to 10,000 feet, but in the sheltered valleys of interior chains of 10,000 to 12,000 feet, only occasional showers fall. In Sikkim and Bhotan the rains are heavy in the wide valleys but in the Lachen valley at the transverse chain it is much drier. *Megna* and *Burampooter* are names of the same river in different parts of its course. The Megna falls into the Brahmaputra; and, though a much smaller river, communicates its name to the other during the rest of its course. The sources of the Brahmaputra proper may be assigned to Lat. N. $33^{\circ} 32\frac{1}{2}'$, and Long. E. Gr. $97^{\circ} 30'$. The first snow covered mountains occur in Lat. N. $28\frac{1}{2}^{\circ}$. The Brahmaputra is called by the Tibetans Zayo-chu, after the province Zayo, through which it flows; the Mishini and Singpho give it the name of Talu Ka. Its direction as far as Lat. N. $27^{\circ} 55'$ is nearly due south; from the entrance of the Galum river to the Du river north-west, and from this point to Sadia south-west. The Brahmaputra rises among gigantic glaciers to the S. E. of lake Mansarowar, runs nearly east for 600 miles and at some places is

a broad stream used for traffic. It receives seven great tributaries each equal to the Ganges discharging about 40,000 cubic feet of water per second. This mighty river runs through the N. E. of India from Brahmakund to Goalpara for a mean length, exclusive of its numerous small curves, of more than 400 miles. The entire surface of Assam presents a gentle uniform slope, with a few insulated granite hills, sometimes of no considerable mean elevation. The Brahmaputra nowhere presents any remarkable contraction of its bed, and the only rapid part of importance is situated fifteen miles below its confluence with the Dihong. The level of the Brahmaputra at Sadia is 210 feet. A little to the south of the entrance of the Tista begins that part of the river where the stream branches off in the shape of a delta, and shortly joins that of the Ganges. The ebb and flood of the tide extend in the season when the river is low, upwards beyond Dacca; the fall from Sadia to the delta consequently amounting to half a foot per mile. Sadia is situated near the spot where the most considerable of its affluents join the Brahmaputra, viz., the Dihong (a river identical with the Tibetan Zambu, into which, before its confluence with the Brahmaputra, flows the Dihong.) The Brahmakund is a very deep basin-shaped enlargement of the river, just before it emerges from the mountains to descend into the plains of Assam. The velocity of the current, which both above and below the Brahmakund is very great, suffers a great diminution at this point. In this S. W. course, along the whole length of the left shore of the Brahmaputra, and nearly parallel to the broad valley through which it runs, we meet with a longitudinal range of secondary hills, inhabited by the various scattered tribes of the Naga, Khassia, Jaintia, and Garo. It disembogues into the Bay of Bengal, through three mouths, after a length, in the plains, of 933 m. It receives in its long course the Sanpoo, 1,000; Dihong, 140; Noh-Dihong, 100; Doree Dehing, 150; Soobu-Sheeree, 180; Monas, 189; Bagnee, 150; Guddala, 160; Durlah, 148; Teesta, 313; Barak, 200; Goomtee, 140 miles. The branches of the Brahmaputra, together with those of the Ganges, intersect Lower Bengal in such a variety of directions as to form a complete system of inland navigation. The Brahmaputra begins to rise in April owing to the melting of the snow at its alpine sources. About the 1st July it is at full flood, and all the level country is submerged, herds of buffaloes, deer and hogs then swim for refuge to the hills. The Brahmaputra drains Assam in every direction. It is known in Assam by the name Hiranyo or golden. In the rainy season it rises 30 or 40 feet above its lowest

level, overflows its banks and inundates the country like an inland sea. In the dry season it is a labyrinth of half filled channels, rendering the navigation intricate and fit only for steamers of light draught. It is not navigable higher than Dibrugarh. As seen from Ogri hill near Tezpur, the river is sweeping along in a bed of from ten to twelve miles in breadth, with numerous islands covered with canes and shrubs. The chief towns on the banks of the river are Bishnath, Durrung, Gowhaty, Goalpara, Nussseerabad. It is navigated from the Bay of Bengal to Dibrugarh near the head of the Assam valley within 500 miles of Pengshaw, the point reached by Captain Blakeson on the Yang-tse-kiang river. Of these 500 miles 300 are known. Colonel Briggs advanced to Sadia 50 miles to the east of Dibrugarh by steamer, and if the intervening distance can be opened, the rich province of the Yang-tse-kiang would be available to India.

The rivers of the northern parts of British India and Burmah are in a tranquil state, from the time of the change of the monsoon in October, to the middle of March; then, the north-westers begin in the eastern parts of Bengal (though later as we advance westwards) and may be expected once in three or four days, until the commencement of the rainy season. These north-westers, which have their denomination from the quarter in which they usually originate, are the most formidable enemies that are met with in the inland navigation, they being sudden and violent squalls of wind and rain; and though of no long duration, are often attended with fatal effects, if not carefully guarded against; whole fleets of trading boats having been sunk by them almost instantaneously. They are more frequent in the eastern, than in the western parts of Bengal; and happen oftener towards the close of the day, than at any other time. As they are indicated some hours before they arrive, by the rising and very singular appearance of the clouds, the traveller has commonly time enough to seek a place of shelter. It is in the great rivers alone, that they are so truly formidable; and that about the latter end of May, and beginning of June, when the rivers are much increased in width. After the commencement of the rainy season, (which period varies in different parts from the middle, to the end of June) tempestuous weather must be occasionally expected. Places of shelter are more common at this season, than at any other, by the filling of the creeks and inlets, as the river increases; and, on the other hand, the bad weather, when it happens, is of longer continuance than during the season of the north-westers. The rivers being now spread to the breadth of

several miles, a strong wind has the power of raising large waves on them, and particularly when blowing in a contrary direction to the rapid parts of the stream; which at such times should be avoided, as much from motives of conveniency, as of safety. During the long interval between the end of the rainy season of northern India and the beginning of the north-westers, one proceeds in security with respect to weather, and has only to observe a common degree of attention to the piloting of the boat clear of shallows, and stumps of trees. These will generally be avoided by keeping in the bend of the rivers nearest to the side that has the steep bank; but not so near, as to be within the verge of its inferior slope. This steep bank has the deepest water, and the strongest current near it; and is therefore, on both accounts, the proper side to keep on, when going down with the stream; as its rate of motion must principally determine that of the boat; for the motion acquired by the oars of a large budgerow hardly exceeds 8 miles a day, at ordinary times. From the beginning of November to the middle or latter end of May, the usual rate of going with the stream, is forty miles in a day at 12 hours; and during the rest of the year, from 50 to 70 miles. The current is strongest while the waters of the inundation are draining off; which happens in part of August and September.

In the very singular navigation across the jhils, or inundations, between Dacca and Nattore, &c., in which 100 miles or more are sailed on nearly a straight course, leaving the villages and groves to the right and left, little difficulty occurs, unless the wind should fall; for, while it continues to blow, it is always fair, during the season of the inundation. The current presents only a trifling obstacle; since its motion (which is nearly parallel to the course of the Ganges) is seldom half a mile per hour.

A tract in the districts lying east of the Brahmaputra, including Dacca and Sylhet, has the greater portion of its surface occupied by the rich plains of Mymensing and Sylhet through which the river Soornia meanders. The old channel of the Brahmaputra, now nearly dry, winds along by Dacca from the eastward. This tract affords a great variety of produce, such as cotton, sugar-cane, rice and other grains.

The Ganges rises in the southern steep of the Himalaya. It receives the Bhagarathi and Alakananda 30 miles of Srinagur, then the Jumna at Allahabad, which rises near; and by the Chambul and Bitwah which drain the north of the Vindyah mountains, then the Sone and

then the Gogra, Cusi and Gandak, the last at Monghyr, where the river is 3 miles broad and 30 feet deep.

The Ganges begins to rise in the end of April and continues to increase till the middle of August when it reaches many places 32 feet, the level districts in its lower course are inundated sometimes to the extent of 100 miles. About 200 miles from the sea the river breaks into a labyrinth of rivers, forming islets covered with woods and known as Sunderbuns, but the force of their waters is insufficient to clear the bar at their mouths and the most western branch—the Hooghly is alone navigable for large vessels. At Gangotri in Garhwal, Lat. $31^{\circ} 3'$, Long. $78^{\circ} 56'$, is a celebrated hindu temple on the right bank of the Bhagiratti in its upper course, and is 10,319 feet above the sea, near the temple the scenery is grand. Four peaks rise, huge, lofty, covered with snow, and the river runs impetuously in its shingly bed, the stifled sound of the stones which it rolls along mixes with the roar of its waters. Soorgaronni is the nearest of the peaks and forms the western point of the great snowy hollow. Roodroo Himala is the eastern, and forms the other point; but from that point runs down a huge snowy shoulder that seems to give off or ends in the mountains that surround and form a great unbroken, though unequal snowy ridge, bounding and confining the glen of the Bhagiratti. The other three peaks form different points in the back of the immense hollow, and altogether compose one of the most magnificent and venerable mountains, perhaps, that the world can produce.

The *Chumbul* river is a tributary to the Jumna. It rises in Malwah, in lat. $22^{\circ} 26'$, and lon. $75^{\circ} 45'$, eight or nine miles S. W. from Mhow, which is 2,019 feet above the sea. It rises on the cluster called Janapava. It runs north, 105 m.; N. W., 6 m.; S. E., 10 m.; N. E., 23 m.; S. W. 25 m.; North to junction with Kali Sind, then N. E. 145 m.; S. E. 78 m. to Jumna: length, 570 m., described in a form nearly semi circular, the diameter being only 30 m. It receives the Chumbela, 70; Seepira, 120; Parbutty, 220; Kali Sind, 225; Banas, 320; Chota kali Sind, 104 m. About 56,000 square miles are drained. The average declivity of its bed is 2 feet 5 in. per mile, and the general character of its channel rugged and rocky. Its average volume of water is so considerable, that at its junction it has been known to raise the united stream seven or eight feet in 12 hours. The nominal source of the Chumbul is in a part of the Vindhya range, nine miles south-west of the cantonment of Mhow; but this part of the river is dry in the hot season, during which it

owes its waters to other tributary streams. The current of this river is in most parts gentle, its bed rocky, and its course through Malwa much obstructed by shallows; but, after entering Harrowtee by an opening in the Mokundra range, it becomes a fine and deep stream. The course of the Chumbul, not reckoning the minor sinuities, is upwards of five hundred miles, and along its banks specimens of nearly every race now existing in India may be found. Sondi, Chunderawut, Seesodia, Hara, Gore, Jadoon, Sikerwal, Goojur, Jat, Tuar, Chohan, Bhadoria, Kutchwaha, Sengar, Boondela, each in associations of various magnitudes, from the substantive state to the little republic commune between the Chumbul and Cohari. The Chumbul runs through the territories of Sindiah and Holcar, viz. Gwalior, and Indore and runs near Kotelia.

The Ganges river by hindoos is esteemed sacred. Many persons, whose relations die at a distance from the Ganges, at the time of burning the body preserve a bone, and at some future time bring this bone and commit it to the Gunga, supposing that this will secure the salvation of the deceased. The work called Kriya-yogasara contains the following curious story:—A bramhan, who had been guilty of the greatest crimes, was devoured by wild beasts; his bones only remained. A crow took up one of these bones, and was carrying it over Ganga, when another bird darting upon it, the crow let the bone fall. As soon as the bone touched Ganga, the bramhan sprang to life, and was ascending to heaven, when the messenger of Yama, the judge of the dead, seized him, as a great sinner. At this time Narayana's messengers interfered. The Ganges is deemed so sacred by all hindoos that such a question as occurs in 2nd Kings v. 12. "Are not Abana and Pharpar, rivers of Damascus, better than all the waters of Israel?" would never arise respecting the Ganges, through contention respecting the superior efficacy of rivers is not uncommon in India. It is, however, generally decided in Bengal, that the Ganges is the most efficacious of all the sacred streams. The Aryan hindu and the non-Aryan races who occupy British India continue to worship springs and fountains and other natural objects. This has been a custom with many races. The fountain of Egeria, the Fontinalia Romana; the Aquæ ferentinæ and the sacred wood where the Feriæ Latinæ were celebrated. These woods and fountains were under the especial protection of some divinity. Pansanias says that at Phocis in Achaia, there was a fountain called Hama, consecrated to Hermes, near which thirty enormous straight

stones had been erected at a very remote period, when instead of images, the Greeks adored blocks of stone. Such was also the religion of Pagan Ireland.

The Indus is a magnificent river, it rises in the Kailas or Gangri range in L. 31-20 N., and 80° 30 E. 1,700 feet above the sea, and has a course of about 1,977 miles. It is known in the Tebatan of Ladak as the Tsang-po, the Sam-po-ho of the Chinese pilgrim Hwan Thsang. A few miles from Le it receives the Zanskar river, and its bed at Pitak below Le is 10,500 feet above the sea. At Mittunkot, the Indus is often 2,000 yards broad and near this place in L. 28-55 N., and L. 70-28 E., it is joined without violence by the Panjnad, a large navigable stream the collected waters of the Sutlej, Beas, Ravi, Chenab and Jelum, after which its bed never shallows in the dry season, to less than fifteen feet and seldom preserves so great a breadth as half a mile. The whole length of its mountain course from its source to Attock is about 1,035 miles and the whole fall is 16,000 feet or 15.4 feet per mile. From Attock to the sea, the length is 942 miles. Its maximum discharge, above the confluence of the Panjnad, occurs in July and August, when it is swollen by the seasonal rains, and it then reaches 135,000 cubic feet, falling to its minimum of 15,000 in December: up to this confluence it is known by various names.

Sam po-ho.....	CHIN.	Saind'hava.....	SANS.
Siu Tow.....	"	Sing-ge chu.....	TIBETAN.
Tsang-po.....	LADAKI.	Sin'h ka-bab....	"
Aba Siu.....	"		

Sing-ge-chu means the lion river; and Sin'h-ka-bab the lion's mouth. From the confluence, in its route through Sind'h, it is known as the Sar, Siro or Sera, down to Sehwan; as the Wicholo or central from Sehwan to Hyderabad, and as the Lar from Hyderabad to the sea. The races occupying the countries near are the Bhot, the Afghan, the Jut, the Beluch, the Brabui the Rajput and the Lar. The Indus guards the western frontier of British India and in all the military operations of the British since 1834, in Afghanistan and Sind, the Indus has been of great value as a means of communication. During the war of 1845-1846 in the Punjab, a bridge of roads was carried up the river as far as Bhawulpur and thence dispatched up the Gharra to Ferozpur, and another branch of the river, the Chenab, was in a subsequent war navigated up to Mooltan. Central Asia is a term used differently by geographers, ethnologists, and politicians, but is usually applied to the region intervening between Russia in Asia, and British India, and lying to the west of Chinese Tartary. Its western boundary is the Caspian Sea and the river Ural, On the east, is the lofty table-land

of the Bolor, (the mountains which form the western boundary of Chinese Turkestan and Dzungaria), and the river Irtysh; and the northern boundary is western Siberia, and it has Afghanistan on the south-east; On the eastern side of Central Asia, is a fertile tract, watered by the great rivers the Jaxartes and the Oxus. The whole country of Central Asia between India and Tartary is one broad mountain range, the Himalaya forming the southern crest, and the Kuen-luen the northern. The interior has some lovely valleys like Kashmir, but it is more usually broken into rocky ravines, through which the affluents of the Indus force their way towards the plains; or else stretches away in those vast treeless uplands, which are one of the chief characteristics of the range through its whole extent. The ascent from Yarkand and Kashgar, westward to the table-land of Pamir, is almost imperceptible: and when that lofty position is gained, where the average elevation is probably as much as 15,000 feet above the sea, a vast open plain is seen, which stretches from the valley of the Jaxartes in one direction, across the head streams of the Oxus, to the top of the Kashgar or Chitral valley in another. This plateau may be 700 or 800 miles in extent. It is studded throughout with lakes, and from it descend four great river systems. The Naryn, which is the main stream of the Jaxartes, runs through a long, luxuriant valley, between the culminating ridge and outer range of the Thian Shan, and drains all the northern range of the plateau. The Oxus, rising in the Sari Kul or Yellow Lake of Pamir, at least 300 miles to the south of the Jaxartes, receives from its right bank a multitude of streams from the rugged valleys on the south-western face of the Pamir uplands. The western face of Pamir between the Jaxartes and the Oxus, is far more precipitous than the eastern. Ridges run out as far as Samarcand and Karshi, and the streams from the upland which twine amongst these ridges form the Zarafshan and Karshi part of the water system of the Oxus, though before they reach that river they are entirely consumed in irrigation.

The water system of the Indus is formed on the south-eastern extremity of Pamir, where the table-land is lost in the rocky summits of Muz Tagh, and a number of streams drain off to the southwards, forming two subsidiary Indus systems. A culminating ridge, Pusht-i-khar or Asses Back, which runs out from the south-east corners of Pamir, is the true watershed between Thibet and Kabul, the streams flowing to the southward being separated by the shoulder which joins the Hindu Kush, from the streams descending through Vakkam and Badakshan to the Oxus, and forming the Kabul river, which falls into the Indus at

Attock, while those that flow to the south-east and are divided by the Muz Tagh range from Tartary, descend through a series of rocky valleys and precipitous gorges into the Upper Indus at Little Thibet. From the eastern face of the Pamir again, which slopes off very gradually into the plains of Tartary, is supplied a fourth water system, in the form of a series of small streams, which passing by Yarkand and Kashgar are ultimately lost in the sandy desert, or in some cases reach the central lake of Lob Nur.

Three large rivers flow through Kaffiristan from north to south, and augment with their waters the river of Kabul and Jelalabad, which ultimately falls into the Indus. The two westerly rivers unite at Tigrari of Lughman, and the joint stream, after a short course of eight or ten miles, falls into the Kabul river at Lergah, in the same district, about a mile to the east of Mandarawar. The easterly river, known as that of Kameh, falls into the Kabul river east of Jelalabad, and at a distance of about twenty-five miles from Kergah. The Kameh flows through Chitral, and its source is more remote. On the east it may be considered the boundary of the Siahposh territory, as the river of Nadjil and Alishang forms the boundary on the west. The sources of the Nadjil river are said to be not very distant, and it is the smallest of the three rivers.

The *Kum Feroz* river, across which Amir-Azan Delemi, built the Band-i-amir, or Bend amir. Aras, is a modern name of the ancient Araxes, the Awerma of the Purans, now called Kum Feroz. It laves the foot of the rock Istakhr. The snowy Ardegan mountains are the same with those which presented so formidable a barrier to Alexander's progress, and by whose slopes he descended into Persia in his advance on Persepolis. Towards the north of Armenia, runs the Araxes, with its numerous tributaries. This river which at its commencement, owing to its many affluents, bears the Persian appellation of Hazara, springs from the side of the Bin Gol, or mountain of a Thousand Lakes, about 30 miles south of Erzerum, and nearly in the centre of the space between the eastern and western branches of the Euphrates. Its course, from its first spring near Jabal Seihan, is almost N. E. for about 145 miles through Armenia; when it turns eastward, being then near the frontier of Kars: this proximity continues for 110 miles. The sources of the Aras and those of the north branch of the Euphrates are about ten miles from one another. According to Pliny those sources are in the same mountain and 600 paces asunder. In modern times, the north-eastern districts, along the banks of the Araxes, intervening between Aderbijan and

Georgia, have been in general subject to the sovereigns of Persia.

Except the Nerbuddah and Godavery unless great engineering skill be applied, there are none of the rivers of Southern India likely to prove navigable or available for military operations. The Sagar and Nerbudd districts form part of the territorial division called the Central Provinces, the principal towns of which are Sagar, Jubbulpur and Hoshungabad. In the valley of the Nerbudda, fossil bones of extinct animals have been discovered of great importance to the geologist. On some of the hill-sides bordering the valley there have been discovered some of those strange flint implements which in other parts of the world have so roused the curiosity of antiquarians. The falls on the Nerbudda river are those of Kapiladhara and Dudh-dhara near its source—the former of 78 feet. The next is at Umaria in the Narsinghpur district, of about ten feet. At Mandhar, ninety miles below Hoshungabad, and about twenty-five below Handia, there is a fall of forty feet; at Dadri, near Punasa, twenty-five miles below Mandhar, there is another fall of forty feet.

The British Government have been trying to make the Nerbuddah and Godavery navigable. The rivers embraced under the Godavery navigation project are the Godavery, Wurdah, Pranhita, Wyne Gunga, Indrawatty, Sebberry, and Pyne Gunga. The three first, however, are the principal streams. The Wurdah takes its rise in the Baitool District, west of Nagpore, and after flowing for some distance in a south-east direction is joined by the Wunna, which passing under Hingunghat, falls to the south, and forms its junction with the Wurdah, at a place called Sweet, eighteen miles south of the latter place. At this confluence are the falls of Zoourate, and under them is the village of Chuhmunder, which is supposed to be the limit of the Engineering operations at present contemplated. The Wurdah flows on to the south-east until, a little before reaching Chandah, it is joined by the Pyne Gunga, when, losing the names of Wurdah and Payne Gunga, the united stream continues under the name of Pranhita to its junction with the Godavery, a few miles below the station of Sironcha. Midway between these confluences is situated the third or Dewalamurri barrier, extending round in a curve for about fifty miles, and midway down this Barrier the Wyne Gunga discharges itself into the Pranhita. From the confluence of the Godavery and Pranhita below Sironcha to the sea, the river carries the former name, although joined at intervals by the Indrawai and other tributaries above specified. Thirty miles below Sironcha lies the second or Enchampally bar-

rier, and eighty miles below this again is placed the first or Sinteral barrier whence to the sea there are no material obstructions to a partial, though not perennial navigation.

The streams running through the Palghaut valley unite about fifteen miles below Palghaut-cherry and form the great Ponany river; they containing gold; and in June, 1832, Lieut. Nicholson visited Darampooray, at the foot of the Shevaroy Hills, Sattiamungalum, Donagan-cottah, Addivarum or Stremogoy and Metapol-lum, where gold is stated, to be found; saw also the gold sands of Polygouth, about 45 miles from Dindigul; natives likewise wash for gold at the branch of the Cauvery, which runs past Darampooram.

The *Tigris* river is known to the people as the *Dijlah*. It is formed of three main branches, the *Diarbeker* stream or true *Tigris*, the *Myafarekin* river, and the *Bitlis-chai* or *Centrites* of *Xenophon*. It enters on the low country near *Jazirah*, and terminates at *Kurnah*. Its fall is much greater than that of the *Euphrates*. It begins to rise in *March*, is highest in *May*, and in *June* returns to its natural level. The *Tigris*, at *Argunna*, is but a little brook, whilst the *Euphrates*, even at *Malatea*, is a very noble river, about a hundred yards wide. The *Tigris* varies as much in the rapidity, as in the depth of its stream, both being governed by the periodical waters that rush from the mountains of *Armenia*, where its sources are about fifty miles north-west of the valley of *Diarbeker*. It flows thence, with a swiftness that gave it the ancient Persian name of *Tir*, the arrow, which is descriptive of its course. The average rate

its current is about seven knots an hour, its first swell takes place in *April*, and is produced by the melting of the winter snows in the mountains; its second appears towards the close of *October*, or the beginning of *November*, and rises immediately after the annual rains in those high regions. But it is only during the spring torrents, that a complete inundation covers the land, and the city of *Bagdad* stands like a castellated island in the midst of a boundless sea. The river *Tigris* is probably evaporated from the upper half of the *Arabian sea* by the winds; while the north-east trade winds take up from the lower half those vapours which feed the Nile with rain, and which the clouds deliver to the cold demands of the Mountains of the Moon. Thus there are two "wind-roads" crossing this sea: to the windward of it, each road runs through a rainless region; to the leeward there is, in each case, a river rained down. The Persian Gulf lies for the most part, in the track of the south-west winds; to the windward of the Persian Gulf is a desert to the river *Indus*.

The Tigris may be considered as having an average width of 200 yards from Mosul to Bagdad, with a current in the high season of about four miles and a quarter per hour. The country is highly cultivated from Mosul to Nimrod on both sides of the river ; but from the latter place to Tekrit, all cultivation nearly ceases ; and it is but partially found in the tract along the river between Tekrit and Bagdad. The Tigris is navigable for rafts at certain seasons from the bridge of Dyar Bekr to Mosul, a distance of about 296 miles. Below the latter place it is more or less so throughout the year, and the descent to Bagdad is performed with such ease and speed that the river is known by the expressive name of the cheap cameliar. Large rafts supported by 200 or even 300 inflated skins are much in use for the transport of goods, and, when the merchants are on board, a small room is raised on the raft in order to give shelter from the sun and rain. During the flood season the voyage is performed in three or four days, whereas at another time it requires about fifteen days. In 1838, the *Euphrates* steamer, under Lieutenant Lynch, went as high as the bund of Nimrod and this officer made a map of the river, from Bagdad to Mosul, by trigonometrical operations between points which were determined by astronomical observations.

The *Euphrates*, the Forat or Forath of the Hebrews and the Perath or Phrath of the Arabs, rises near the shores of the Black Sea and disembogues into the Indian Ocean after a course of 1,900 miles receiving in its course the Mahmah Khatim from the plain of Tejrán. It has two great sources in the Armenian mountains, the more northern of which is in the Anti-Taurus, 25 miles N. E. of Erz Rüm.—*Schlagintweit, General Hypsometry of India, Vol. II. p. 98. RIZINUS-OHL. GER. Castor oil.

RJAO. HIND. *Eragrostis esculentum* ; Kaura-ro, HIND. is *Pandera pilosa*.

ROADS have existed in India from the most ancient times, but since artillery has been used in war and since parts of India have been in the possession of the British, the French, the Dutch, the Portuguese and the Danes, greater efforts have been made to extend them. Roads were made by the Greeks and Romans, but never by the Arab or the Jew. Lord Dalhousie, commenced during his administration, a road for the line of traffic from Hindostan to Central Asia, from which, even in an unfinished state, great benefits undoubtedly have arisen. It was commenced in 1850 ; the original idea was, that the road should be available for wheeled carriages through its entire length. This plan has now been abandoned and a good road for laden mules is in progress to the Chinese boundary.—*Cleg. Punj Rept. p. 65.*

ROBER WEINSTEIN. GER. TARTAR.

ROBINIA MITIS, Linn. *Pongamia glabra, Vent.*

ROBIN. The Indian Robin, or Dayal-bird, *Thamnobia fucata*, is generally distributed over most parts of Hindostan. It is always found near the habitation of man. In manner and habits it is the oriental representative of the red-breast, just as the migratory thrush takes the place of the thrush with the Canadian emigrant. In the elevations of the Kandyan country there are a few birds such as the Robin of Newera ellia and the long-tailed thrush, whose song rivals that of their European name-sakes ; but, far beyond the attraction of their notes, the traveller rejoices in the flute-like voices of the oriole, the Dayal-bird, and some others equally charming ; when at the first dawn of day, they awake the forest with their clear reveil. The *Copsychus saularis*, Linn, is

called by the Europeans in Ceylon the "Magpie Robin," but is not to be confounded with the other popular favourite the "Indian Robin" *Thamnobita fulvicata*, Linn, which is never seen in the unfrequented jungle, but, like the cocoanut palm, which the Singhalese assert will only flourish within the sound of the human voice, it is always found near the habitations of men.—*Tennent's Sket. Nat. Hist.*, p. 41. *E. L. Layard.*

ROBINIA MACROPHYLLA.

Ganji.....HIND.

A huge climber, common a little to the west of the Jumna.

ROBLE. PORT. SP. also Carbalho, PORT. *Quercus*, the oak.

ROBINSON, in a paper upon sundry of the border of tribes of Assam, in the B. As. Journal, No. 201, for March 1849, Mr. Robinson asserted the affinity of these tribes (the Bodo and Garo amongst others) with the people of Thibet.

ROBO, also Roboklu. See Tin.

ROBUR of Candahar, the Fox, *Vulpes flavescens*, Gray.

ROCCELLA, a genus of lichens of the natural order Lichenes. These are largely exported from Ceylon, Bombay, Mozambique, Angola, Lima and Cape Verde under the term orchella weed. *R. fusiformis*, its allies and varieties, occur on trees in tropical or subtropical countries near the coasts. The species are used in dyeing, and are popularly called orchill, or archil, terms derived from the oricello of the Italians or the Spanish orchella often corrupted in commerce into Rochilla-Weed. *Rocella fusciformis*, the flat-leaved orchil, is found on maritime rocks, or on dry stone walls exposed to the influence of the sea-breeze, as well on the coast of England as on the shores of the Mediterranean and the East Indies. The more arid the situation, the better is the quality of the lichens. The presence of the colouring matter is ascertained by steeping the weed broken up in small pieces in diluted solution of ammonia, in a bottle half filled with liquid, which should be kept corked, but frequently opened in a temperature not exceeding 159° Fahr.

ROCCELLA MONTAGNEI. Belangen. HIND.

ROCCELLA TINCTORIA. Dyer's Roccella, or Orchil, when good has a mealy white powder on its surface towards the centre; the under surface is of a gray colour; and is not hairy; if wetted, it does not turn of an orange colour: its edges are flat and thin, and various lichens, from Tenasserim and other parts of India, were introduced into Britain by the East India Company. Specimens of varieties of the lichens used in the manu-

facture of cudbear, orchil and Etnaus, and of the substance obtained from them were shown, in the British department, of the Exhibition of 1851 for which were awarded prize medals.—*Simmonds, Hogg's Vegetable Kingdom.*

ROCK-BO. See Tonking.

ROCK CRYSTAL.

Shwin-tsing,	CHIN.	Balur	HIND.
Shih-ying,	„	Balun ka-pat'har „	

Ceylon affords all the varieties of quartz, rock-crystal, amethyst, rose-quartz, cats'-eye, and prase. Rock-crystal occurs in abundance, both massive and crystalized, of various colours, good quality and in large masses.

Amethyst also is pretty abundant, very beautiful specimens of this mineral are found in the alluvion, derived from the decomposition of gneiss and granitic rock, in Saffragam and the Seven Korles. A large crystal of it was found near Buauwelle, containing apparently two distinct drops of water. Rose-quartz, is pretty common, and is often found in the same place as amethyst. Ceylon produces the finest cats'-eyes in the world, indeed the only kind that is highly esteemed, and that brings a high price. The best specimens have been found in the granitic alluvion of Saffragam and Matura. Prase is of rare occurrence in the island, only amongst the pebbles on the shore of Trincomalee. Natives are extremely skilful in carving rock crystal into beads, cups, &c.

The districts in British India, richest in quartzose minerals, rock crystal, amethyst, prase, chrysoprase, heliotrope, plasma, mocha stone, calcedony and onyx are those of Dowlatabad along the banks of the Seena river and the neighbourhood of Cambay.

The village of Aurangpur is situated in a small valley surrounded by hills, and the roads leading to it from all sides are, for a distance of three miles at least from the village, impassable to any but foot passengers and cattle, from their rocky and precipitous character. Its mines of rock-crystal are situated about two or three miles to the south-west of the village, and can only be approached by paths like those just described. The deposit of crystal occurs in a small valley or basin among these hills, about two or three miles to the south-west of the village of Aurangpur. The valley is about 500 yards long, and from 50 to 100 yards broad, and dips towards the north. The only part of the deposit which has been worked is the south end.

The mines of rock-crystal at Vellum near Tanjore are of great value and the stone is cut into a great variety of ornamental objects. See Cambay.

ROCK SALT. See Hormuz, or Ormuz. Salt; Salt Range.

ROCKEB-EL-JAMMAL. ARAB. Chenopodium viride.—*Rozb.*

ROCHANA. SANS. from rock, love.

ROCK NOSED WHALE. Balæna mysticetus, var. c.

ROCK OIL or Petroleum.

Shi-yu..... CHIN. | Bbumi-tailan..... TAM.
Mitti-ka-tel... HIND. |

Petroleum is found in the Island of Cheheduba, when reported on by Captain Halstead there were two wells sufficiently near each other to afford the conclusion of their possessing one common source, they exist in the Kraore circle, yielding annually about 60 pots each. A third was found in the "Mromee" circle, but it had been destroyed by fire and yielded nothing, being the property, then of no one in particular, the soil around it, was however, full of the oil. The fourth and most extensive is in the Frangroa circle and yields near 200 pots in the year. The method of collecting it is simple: the earth is turned up to a depth of two feet, and a bank of soil raised round a square of about 20 yards, is distributed so as to form it during the rains into a shallow pond of about the above depth. The surface of this pond is in a constant state of ebullition from the escape of gas with which comes up the petroleum. It collects on the surface in three different forms; a green fluid oil first spreads itself over the spot where the gas is bubbling up. As it extends, its edges exhibit a brown curdled substance resembling half congealed dripping, and amongst this, as it becomes thicker is seen gathering in spots a dark brown substance of the color and consistency of treacle. This latter is used to preserve wood, to saturate paper for umbrellas, and is sometimes burned. But the fluid of a green color, is that mostly used to supply lamps. The curdled substance is used with the dark in the coarser purposes to which it is applied. This is the least valuable and sells at 5 pots for a rupee. The other two at 3 pots for 2 rupees. A bamboo is used to skim the surface of the ponds, and bring the substance to the bank, it is scooped up with a cocoanut shell and put into the pot. It floats so lightly on the water that this process is quickly and effectually performed. The break of the day is the time chosen for the operation as from the cooler temperature, it is then of harder consistence on the water and easier and cleaner skimmed. In the heat of the day it becomes so fluid as to make it difficult to collect without a large proportion of the water. In the months of March and April the pond gradually dries up, and the oil can then be no longer collected from

out the soil. The pond is then dug and the whole soil in it is as much disturbed as possible: on this operation depends the quantity to be yielded during the next season, and the deeper it is dug, the larger will be the produce; while on the other hand, if it be neglected, which is most commonly the case, the quantity of oil to be collected will be very materially diminished. A sort of superstitious fear is attached to these ponds, and on no account would a native dip his foot in its water, though he will not hesitate to dig the soil when dry, nor to handle its produce, to which no sort of deleterious property is attributed. The state of ebullition without apparent heat may occasion this feeling among them. The ponds are surrounded by a rough hedge of stout sticks, to preserve them from the intrusion of buffalo or deer. Insects were seen in them. No heat is perceptible at the surface, the thermometer where the greatest ebullition was going forward showing but two degrees more than the atmosphere. viz 74. No doubt this mineral product might, with ease and little expense, be increased to a very large amount, and the oil has yet perhaps to be better known and better appreciated than now when its value will in all probability be much increased.—*Captain Halsted's Report in Mr. Rohde's MSS.* See Asphalte; Naphtha; Bitumen; Petroleum.

ROCK-GROUSE. Species of Pterochida.

ROCK-PIGEONS, the Columba livia, congregate in deep wells, in the sides of which they breed; the Senegal dove Columba senegalensis, is frequently observed by the sides of hedges, in gardens and way-sides.

ROCK-ROSE, the genus Cistus, one of the Cistaceæ, ornamental plants mostly used for ornamenting rock-work, though some grow to the height of four feet; they do well in most garden soils, and may be cultivated either from seed or by cutting.—*Riddell.* See Evergreens; Ladanum; Labdanum.

ROCKY ISLAND, in the China Sea, is a small island in lat. 0° 54' N., and long. 106° 48' E.

ROCOU. FR. Arnotto.

ROC, rukh or rokh, a bird of gigantic stature, supposed, if not fabulous, to be now extinct, and to have inhabited Madagascar: mentioned in Sinbad and Ibn Batuta's voyages.—*India in the 15th Cent.*

RODING. See Kelat.

RODRIGUE. An island in the Indian
 Ocean, in lat. 19° 41' S., long. 63° 29' E.,
 extends about 15 miles, and is about 6 or 7
 miles in breadth.

RODUNG. In the trade lists of the N. W.
 Frontier of India, are two kinds of madder, one
 called "rodung kuhree," grown at Kandahar,
 which is superior, and the other kind "rodung
 phurreah." The plant is stated to require three
 years to come to maturity. The value of
 madder brought through the Biluch and Afghan
 mountains, is stated to be £12,228. Multan
 is a great emporium for madder. The Kabul
 merchants come thither direct from Dera Ismail
 Khan, via Leia and exchange their madder for
 cotton and indigo.—*Mr. Davis in Powell's*
Hand Book, Vol. 1. p. 463.

RODYAH, a forest race amongst the Kan-
 dyans. They are skilful in the manufacture of
 rope from the black fibre of the leaf stalk of
 the *Caryota urens*.

 librarian to the Bengal Asiatic Society, Cal-
 cutta.

ROG DUT Rye.

ROGA CHETTU, or Pindi bouda, TEL.
Anisochilus carnosus, *Wall*.

ROGEWYN or Regewin Island, sometimes
 called Passage Island, in the Pitt Strait, is
 small and lies near the southern shore, in
 its western entrance.

ROGHAN. PERS. Oil; Ointment; Balsam;

ROGHAN-I-BALSAN. PERS. Balsama-
 dendron Gileadense. Opobalsam.

ROGHAN-I-BED-ANJIR. PERS. Castor
 oil.

ROH, PUNJABI, a hilly district, hence
 Rohilcund.

ROH, a district bounded on the east by
 Suwat and Kashmir; west by the Helmund;
 north by Kashkar or Chitral and Kafiristan
 and on the south by the river or sea of
 Bukkar.

ROHANA. URIA. ? TEL. A tree of Gan-
 jam and Gumsur, of extreme height 80 feet;
 tolerably common and burnt for firewood;
 wooden pestles and ploughshares are some-
 times made of this wood.—*Captain Mac-*
donald.

ROHL. HIND. PJI., a kind of soil, or stiff
 loam.

ROHILCUND, a Rohilla jaghir. Here, the
 pathan race are numerous, but form only a small
 part of the population. The district is in the
 N. W. Provinces of India, and has the
 towns of Bareilly, Bijnore, Moradabad,
 Badaon, and Shah Jehanpur. The first
 settlers of the Rohilla Afghans were two
 brothers, Shah Alam and Hoosain-Khan. The
 son of the first of these, Daood-Khan, achieved
 some distinction in the earlier part of the
 18th century. But the rise of the family is
 owing mainly to his son, Ali Mahomed Khan,
 said to have been of hindoo extraction, but
 who was adopted by Daood Khan. When the
 Mahrattas had, in 1771, placed Shah Alam on
 the throne of Delhi, they turned their attention
 to the conquest of the Rohilla country. On
 the cession of Rohilcund to the British
 Government in 1801, the family were con-
 tinued in their possessions. Ahmad Ali Khan
 died in 1839. The succession of his only
 daughter was rejected, and the next heir,
 Mahomed Saeed Khan, the eldest son of
 Gholam Mahomed Khan, was put in posses-
 sion of the estate. For his services during the
 rebellion of 1857, the nawab received a grant
 of land yielding Rupees 1,04,400. It was
 at first intended to grant the pergunnah
 of Kasheepore, but villages on the Moradabad
 and Bareilly frontier were afterwards substitut-
 ed. "The nawab also received the digni-
 ty of knight of the most exalted order of
 the Star of India. The area of the Rampore
 Territory is 1,140 square miles, and the
 population is 390,232. In Rohilcund, the
 mahomedan landlords rose in the revolt
 of 1857, and not the hindu. The latter
 suffered much in the interregnum, and were
 sincerely glad at the restoration of peace.
 The Boksa, are a forest tribe in western
 Rohilcund, and in part of the forests of the
 Sewalik hills of Dehra Dhoon. They are of
 short stature and spare habits with broad faces,
 depressed noses, prognathous jaws, thick lips,

very scanty beard and mustaches, but not darker in colour than the ordinary hindus of the country. They are reputed to be skilful in witchcraft. They are very ignorant and indolent, but simple, inoffensive and good humoured. They have a scanty rude cultivation, and collect forest produce and wash gold, but they have no caste, eat almost anything. They have no separate language. They are supposed to be dying out. They are said to enjoy a wonderful immunity from the effects of malaria. The Bhihar are an aboriginal tribe of the upper Doab, called in the Doab, Bheimhar and in Rohilcund, Behar. They were expelled from Nirauli and the neighbouring districts by the Bir Gujar rajput. The Bhar of northern India, called also Bharat, Raj-bhar and Bharpatwa, an aboriginal race following the meanest of avocations, especially that of swineherds. In the hills east of Mirzapur, there are some Bhar rajas. Tradition ascribes to them the whole country from Gorapur to Bundelkund and many old stone forts. Prof. Wilson supposes it possible that the name comes from Bharata an ancient name of India.

Aharwarrah is a territory which contains many districts in the north-east frontier of Malwa. The tribe or caste are the Ahar, from whom the territory derives its name of Aharwarrah and the Aharat, are spread through Rohilcund and other districts in the N. W. Provinces, following pastoral pursuits. They claim to be descended from the yadu race of Rajpu's. See Rajpoot.—*Aitchison's Treaties*.

ROHILLA, PUSHTU. A term by which Afghans in Western India are known. From Roh, a mountain, hence Rohilla, an inhabitant of the mountain, also Rohilcund. Colonel Tod states that some of the Affghans being driven from Egypt by one of the Pharaohs, they wandered eastwards till they arrived under that peak of the mountains west of the Indus called Sulimani-koh, or "Hill of Solomon," where they halted. Others draw their descent from the lost tribes. They are a very marked race, and as unsettled as their forefathers, serving every where. They are fine gallant men, and when managed by such officers as Colonel Skinner, make excellent and orderly soldiers; Rennell describes the Rohilla of Rohilcund as a tribe from the mountains that lie between India and Persia, who erected an independent state on the east of the Ganges, and within 80 miles of Delhi. The Rohilla, who conquered the extensive territory in which the city of Bareilly stands, and bestowed on it the name of Rohilcund, were a tribe of Affghan Mahomedans. Their intolerance drove the greater part of the hindoo inhabitants from the tract; but successive swarms from Affghanis-

tan supplied the place of those fugitives, and kept the country in a high state of cultivation. The restless and enterprising character of the Rohillas led to constant encroachments by them on the possessions of the Nawab Vizeer of Oudh. The latter, wearied with resistance, claimed British aid as his allies; and Mr. Hastings, actuated undoubtedly by a foresight of the consequences which might ensue from such an influx of mahomedan soldiery into the territories within the Ganges, undertook the war. The Rohillas were subdued; and their country was made over to the Nawab Vizeer; a portion of it containing the city of Rampore with some dependent towns, being assigned to the heir of Hafiz Rahmat as a jagheer which was to be held of Oude on feudal conditions; subsequently, the provinces in question were ceded to the British by the Nawab Vizeer, and the sealty of the Nawab of Rampore was transferred to the British Government.—*Rennell's Memoir*, p. 19. *Marquis of Hastings' Private Journal*, Vol. II p. 114-115.—*Wilson's Gloss. Mr. Campbell*, p. 47. *Malcolm's Centr. Ind.* Vol. I. p. 325. *Tod's Rajasthan*, Vol. I. p. 672.

ROHINI. A constellation, personified as one of the wives of the moon. See Budh; Krishna; Surya; Uma.

ROHIRA. HIND. *Tecoma undulata*.

ROHITA SARASHUPA. SANS. Cress seed.

ROHITA, the son of king Harischandra given by Varuna but subsequently required as a sacrificial victim by the same. See India.

ROHITAKA. TEL. Amoorā rothituka. W. & A.

ROHRI. A town on the bank of the Indus immediately opposite to the island of Bukkur. Rohri is an ancient site, no doubt succeeding Alor, the capital of Upper Sind at the period of the mahomedan invasion, and whose remains are still known and pointed out near it.—*Masson's Journeys*, Vol. I. pp. 362 and 363.

ROHTUCK. A district of the Punjab. Its principal products are grain of all kinds, saccharine articles, cotton, ghee, and saltpetre.

ROHU or Rohoo, HIND. *Cyprinus denticulatus*. The "Ro-hoo" and the "Mir-gah" resemble each other in size and habits; they are very much like the salmon, but have tiny little mouths with no teeth. The "ro-hoo" in season has very pretty red fins, and both have ash-colored backs, with silvery bellies; they attain to the weight of 20 lbs., and afford the angler excellent sport at bottom fishing, sometimes engaging him for an hour before he can attempt to land his fish.

ROHUN. BENG. also Rohuna, Rohitaka. HIND. *Soymdia febrifuga*, *Juss.*

ROHUN BARK. Rohun-ke-chilki. Rohunæ Cortex, Bark of *Boymida febrifuga*, is not spotted with rusty patches, and the inside is dark reddish brown, nitric acid does not stain it of a bright scarlet. These tests distinguish it from the poisonous bark of the nux vomica tree (Kuchila,) which is commonly sold for it in the bazars of Bengal.—*Beng. Phar.*

ROIELLEO. TEL. Prawn.

ROIN. HIND. A kind of bell-metal, the Bawan of Amritsar.

ROIONG. HIND. *Dolichos uniflorus*.

ROJHA, also Rojhan. See Khyber; Kelat.

ROKA. According to the statements made to Mr. Crawford by Bugi traders, themselves settlers in the island, Flores is inhabited by six different nations, speaking as many different languages; the Ende, the Mangarni, the Kio, the Roka, the Konga, and the Galeteng, names derived from the principal places of their residence. Captain Keppel says that the natives captured from the island used to be much esteemed by the Celebes pirates, as slaves, and he gives the following translation from a Dutch journal:—"On the island of Flores, there lives a race called, on the south coast, Rakka, who not only devour their enemies, but with whom custom requires that the son shall cut the body of his deceased father in pieces, and sell the flesh to the inhabitants at the high price of its weight in gold. This flesh is greedily eaten by the people as a great delicacy. If the father was heavy and of great size, the son considers himself particularly fortunate. The population of Endore, on the same island, is also very greedy of human flesh. But these cannibals confine themselves to the heart, which, with incredible dexterity, they extract from the body, by giving a blow under the left shoulder blade. It is then cut into very small pieces, eaten completely raw by the bystanders, who belong to the same race." Captain Keppel adds, I am not able to corroborate this, Galeteng is a locality in the island of Flores, occupied by a race so called.—*Horsburgh. Bilmore, iii. Keppel's Indian Archipelago, Vol ii. p. 149. Crawford's Dict. p. 1. See India, p 352.*

ROKA. See Eloaja.

ROKAM—? A light red coloured wood of Penang, used for boxes and furniture.—*Cat. Ez. 1851.*

ROKEN. GER. Rye.

ROKRI. A village near the Indus, in the Bunno district, near it are found remains of Greek sculpture.

ROL. HIND. Alum shale.

ROLA. HIND. An artificial colored powder made of the *Trapa bispinosa* flour, colored with "kussumba" and "kamela," &c. It is

used by hindus during the carnival, or holi festival to throw at one another.—*Powell's Hand-Book, Vol. I. p. 454.*

ROLONG, the hard central part of wheat grains. See Sojee; Wheat.

ROMA. A considerable island, near Timor, in lat. 7° 44' S., and long. 127° 19' E.

ROMAN CATHOLIC. A sect of christians who recognize the Pope of Rome as their spiritual and temporal chief. They form in India the largest body of the native christians. The dates of Romish doctrines, are

ROMAN CHAMOMILE. *Anthemis nobilis.*—*Linn.*

ROMANIA ISLANDS. Fronting Point Romania, which is in lat. 1° 22' 12" N., are six in number, and extend for about 2½ miles.

ROMAN TOGA. See Karen, p. 456.

ROMANS. A name applied to the rulers and people of ancient Rome, who succeeded the Greeks in their Asiatic territories. The Romans conquered most parts of Europe, the northern part of Africa, Syria and Palestine and left lasting improvements in the roads and education of the countries which they occupied. Romance languages, viz., Italian, Wallachian, Provencal, French, Spanish, and Portuguese, are closely related to each other, all derived from Latin. Among the hindoos of India are many social customs similar to those of the ancient Romans. As regards the proprietary right of land, we find a form of ownership in British India which ought at once to rivet our attention from its exactly fitting in with the ideas which our studies in the law of persons would lead us to entertain respecting the original condition of property. The village community of India is at once an organized patriarchal society and an assemblage of co-proprietors. The personal relations to each other of the men who compose it are indistinguishably confounded with their proprietary rights, and to the attempts of English functionaries to separate the two may be assigned some of the most formidable miscarriages of Anglo-Indian administration. So soon as a son is born, he acquires a vested interest in his father's substance; and the domain thus held in common is sometimes administered by an elected manager, but more generally by the eldest representative of the

oldest line of the stock. The village community, however, is more than a body of co-proprietors ; it is an organized society having its staff of officers for internal government. This seems evidently the type of the *Gens*, or House, of the ancient Romans, and it is remarkable that, although both in India and at Rome each community was assumed to have sprung from two common ancestors, the fact was that these houses and villages were recruited by new members who were admitted by adoption or by some analogous process. Nor are those proprietary brotherhoods confined to India. The researches of Haxthausen and Tengoborski have lately proved that the Russian villages are organized communities of a similar character. And the same principle seems to prevail in Servia, in Croatia, and the Austrian Slavonia—in fact, wherever feudality has had small influence, and wherever there is the nearest affinity between the Western and the Eastern world. Nor is the observation unimportant that the colonists of New Zealand were long engaged in disputes with the natives which turned upon the precise point under discussion. While the Colonial Government insisted that any member of a tribe is entitled to sell his land to whomsoever he pleases ; the natives insist that although one member may transfer it to any other member of the same tribe, he cannot transfer it to any person who is not a member without the consent of the whole tribe, because of the existence of what has been called a tribal right. This instance certainly tends to show that in the mind of a New-Zealander the idea of joint ownership precedes that of separate ownership. By the Roman law, the father was certainly regarded rather as a steward than a proprietor of his goods, and accordingly was not, at first, permitted to dispose of his property as he pleased after his death.

According to the author of the *Periplus of the Red Sea*, Arabia Felix or Aden had been destroyed by the Romans shortly before his time, and Dean Vincent is of opinion that the Cæsar in whose reign this event took place was the emperor Claudius. The object of destroying so flourishing a port is not difficult to determine. From the time that the Romans first visited Arabia under Ælius Gallus, they had always maintained a footing on the shores of the Red Sea, and it is probable that Claudius, being desirous of appropriating the Indian trade to the Romans, sought a pretext of quarrel with Aden in order that he might by its destruction divert the Indian trade to the parts of Egypt. Valerian, Roman sovereign having been conquered by Shapur in a fort near Antioch, was led into Susiana ; where the Persian monarch under taking some extensive structures (at Shush-

er), obliged his captive to assist in the work, by procuring experienced artists from Rome or Greece, and he promised that liberty should be the reward of the co-operation. The task was performed, and Shapur observed his promise ; but first cut off the Roman chieftain's nose, to brand him with an indelible mark of captivity. The Romans generally burned, but they sometimes buried ; their dead children who died in infancy were interred in the immediate neighbourhood of their former homes. Their sepulchral urns with the ashes of the dead were commonly buried about two feet below the surface, and their memorial stones were often inscribed. They used the sarcophagus or massive stone coffin and also the tumulus or barrow. The Romans bore their dead with much lamentation to the funeral pile, on which, after being lighted, they cast the robes and arms of the deceased, as well as the slaughtered bodies of his favorite animals. The Romans had peculiar modes of divination : their *dies fasti*, *nefasti*, their auguries, &c. ; amongst the hindooes, although they are not individually acknowledged except in confined districts, and although the legality of their worship is sometimes denied by the bramins, are the village gods, of which each village adores two or three, as its especial guardians, but sometimes as its dreaded persecutors and tormentors. They bear some resemblance to the penates or lares of the Romans ; and, like them, they are sometimes the recognized god of the whole nation either in their generally received characters, or in local incarnations but much oftener they are the spirits of deceased persons, who have attracted the notice of the neighbourhood.

The writing character of the ancient Romans is now used by most of the people of Europe and by the British and their Colonies.

With much in common, in the several Indian tongues, it at first seems an easy matter to become acquainted with them. But at the first step there is this difficulty that every dialect has its separate alphabet and every province has two or three alphabets in use. The various nationalities cannot use each others books nor write to each other. Even were it possible out of the fourteen current alphabets of India to select one for universal use, there is not one of them which it is not extremely difficult to read, difficult to write, and difficult to print. The natives themselves cannot read them fluently. Even pundits and moonshees are continually obliged to pause for the purpose of spelling the words. A fluent reader of any of the native characters is almost unheard of, but a mere boy who is taught the Roman characters, will, in the course of a few months read anything that is given to him.

without stopping. Writing, it may well be imagined, is still more difficult. As a general rule it is impossible to write fast in the native alphabets without making so many blunders and omissions that the manuscript becomes an unintelligible scrawl. The greatest difficulty of all, however, occurs in printing. For one dialect a fount of type is required consisting of not less than 700 letters, simple and compound; another requires 900 letters; a third 1,000, and so on, the cost of preparing such a fount and the difficulty which a compositor has to contend with in having a "case" before him with this prodigious collection of characters are great. With one character in common use, it would be comparatively easy to frame two dictionaries—one with words common to the Arian family, the other with Dravidian words; but the many written characters has rendered that impossible, and before the end of the 19th Century if no unexpected change occur, the English language will have become the chief medium of intercourse between the various races in British India.—*Muller's Lectures*, p. 163.—*Ouseley's Travels*, Vol. 1. p. 287. *Ed. Jour.* July 1867, quoting *Madden's Sepulchres*, Vol. I. p. 362-457. *Elphinstone's History of India*, p. 179-180. *Kennedy on the Origin of Languages*, p. 16. See Lustral ceremonies; India; Infanticide; Linga; Magnetic Needle; Polyandry; Viswakarma.

ROMANZONITE. See Garnet.

ROME. See Sanskrit; Semitic races.

ROMISCHE HAMILIER. GER. Camomile.

ROMUSK. HIND. *Rhamnus virgatus*.

RONAK. HIND. *Stipagrostis plumosa*.

RONDELETIA ASIATICA.—*Linn.* Syn. of *Stylocoryne Webera*.—*A. Ridi*.

RONDELETIA TINCTORIA.

Ta-ma-yok....BURM. | Toora loth....HIND.

A small tree, of the Kotah and Mewar jungles, wood dark-brown, adapted for the fineness of the grain and elegance of colour, for ornamental work: the bark is used in dyeing red. In Pegu, the *Rondeletia tinctoria* together with *Mangifera attenuata*, *Anacardium occidentale*, *Zizyphus jujuba*, *Averrhoa carambola*, *Pierardia sapota*, *Ancestrolobus carnea*, *Ancestrolobus mollis*, are all adapted from the fineness of their grain and elegance of colour, for common work. Its wood is a of dark brown colour.—*Drs. McClelland*, p. 134. *Irvine Genl. Med Top.*

RONDU. The villages of Rondu, are mostly small; they have abundance of fruit-trees. The apricot of which is the commonest. All over the hills of Rondu, the juniper is rather common, and seemingly quite at home both on the higher ridges, and in the bottom of the ravine close to the river. Rondu is remarkable

for producing a true pine, the *Pinus excelsa*. As soon as the ground is clear of snow, the manure which has been accumulated during the preceding year, consisting of the contents of the cowhouse and stable, mixed with every sort of refuse, is carried in small baskets to the fields, on which it is deposited in small heaps. It is then spread uniformly over the surface by hand. Occasionally the field has had a previous ploughing, but it is more usually in the state in which it had been left after the harvesting of the previous crop.—*Dr. Thomson's Travels in Western Himalaya and Tibet*, pp. 256, 257, 259.

RONG. MALAY. SIAM. Gamboge; Hebradendron gambogioides.—*Graham*.

RONGDO, meaning the district of defiles, is an elevated district on the bend of the Indus, and on the frontier of the Gilgit and Hasora countries. It is to the westward of Balti and has an area of 1,440 square miles. It is about 8,000 feet above the sea, the mean of its villages being 6,200 feet. The people are of Tibetan habits. See India; Kailas or Gangri Range; Maryul; Skardo.

RONG-GENG. BURM. Dancing girls of Burma.

RONGUEDUE, Ronkedor or Runkedor.

SINGH. A rogue or solitary elephant.

RONG-YUL. See India; Maryul.

RONTAL. JAV. *Borassus flabelliformis*.

ROOA—? A coin.

ROODER-PRAGUE. See Kedarnath.

ROODRA. SANS. from rood, to cry. See Rudra.

ROODRAKKHU. BENG. *Eleocarpus ganitrus*.

ROODRAKSHA. SANS. from Roodra, a name of Siva and Aksha, an eye.

ROOH. A spirit. Rooh-i-sifin lower spirit; Rooh-i-Jari, a travelling spirit; Rooh-i-Moqeen, a resident spirit; Rooh-i Aolwee, the lofty spirit.

ROOI. HIND. Cotton wool. *Gossypium Indicum*.—*Lam*.

ROOK. *Corvus fragilegus* of Europe, N. and W. Asia, Afghanistan, Poshawur valley, Kashmir; replaced in China and Japan by *C. Pastinator*.

ROOKMINI. SANS., from Bookma (gold), the name of a king.

ROOKN-I-YAMINI.

ROOKOO. ARAB. The stooping posture in prayer. Rookoo-kee-tusbeeh, ARAB. Beads held in the hand at prayers.

ROOMEE-MUSTKI, BENG. *Pistacia lentiscus*; mastieh.

ROONAH. A river near Narraingurh in the Sabbathoo circle.

ROOPEE, or Roopen. See Kunawar,

ROOPOOR. See Kunawar.

ROORADEA. URUA. A tree of Ganjam and Gumsur, extreme height 12 feet, circumference 1 foot, and height from the ground to the intersection of the first branch 3 feet. The fruit is eaten; but no use is made of the wood.—*Captain Macdonald.*

ROOSA OIL. ANGLO HIND. or Grass oil is obtained from the *Andropogon calamus aromaticus*, a native of the low hills at the base of the Himalaya; also found at Asseerghur, in Malwa Guzerat, and the Dekhan. The oil is chiefly imported into Bombay from Surat, and is re-exported in considerable quantities to England, China, and the Arabian and Persian Gulfs. It is highly esteemed by the natives of India as a cure for rheumatism, colds, and as an internal stimulant. This oil differs but little either in appearance or quality from the Lemon Grass Oil, it is a useful rubefacient, and to be a good substitute for the more expensive cajeput oil.—*Faulkner. M. E. J. R.*

ROOSTUM. A hero famed in Persian romance. Felamorz, the son of Roostum, was defeated by Behram near the fort of Fessa, between Shiraz and Darab. Behram caused Felamorz to be hanged, and his tomb existed in the village, until, it is said, a European traveller removed it away, as a relic.

Ropes are made of hemp, coir, cotton, straw, and other fibrous materials, spun into thick yarn, of which several strings are twisted together by means of a wheel. All the different kinds of rope from a fishing line or whipcord, to a cable, go by the general name of cordage. Among the cordage sent to the Great Exhibition of 1851, Messrs. Harton and Co., rope makers of Calcutta, sent ropes of excellent quality, said to be made of Jubbulpore hemp; its strength was proved to be at least equal, if not superior, to that of Russian hemp, when a Petersburg hemp broke with 160 lbs., one of Jubbulpore Hemp did not break with less than 190 lbs., it was considered an excellent

substitute for Russian hemp, and was valued as worth at from £30 to £35 a ton. Dr. Falconer has pronounced Jubbulpore hemp to be the *Crotalaria tenuifolia* of Roxburgh, which Wight and Arnott, and some other botanists, regard as merely a variety of *C. juncea*, the plant affording the well known "Suun Hemp" of commerce. But the habit differs very much from that of *C. juncea*. Jubbulpore hemp has been tested several times in the Government service, both Military and Marine, and some ropes have been found equal to the staple cordage of Europe. A coil of bolt rope, manufactured from it, tested in the Marine Department, broke with a strain of 57 cwt. A coil of the same size, taken from one of H. M.'s vessels, broke with a strain of 59 cwt. Mr. Williams, was only able to grow it on the sides of the hills; when cultivated in the lower provinces, although it attains a great height and grows luxuriantly, it is weaker in fibre and the produce smaller in quantity than when grown higher up the country.

Mandal straw rope, is made from Eleusine coracaria. The straw is flat and excessively tough, so much so that in gathering the crops the heads are pulled off by hand, leaving the whole straw standing.

Manilla Rope is made of plantain fibre, and used for running rigging for ships, or tackling for land purposes.

Hemp rope from the *Cannabis sativa* is used for standing rigging for ships, or for use in water.

Rope made of *Sesbania aculeata* is used as running rigging for ships, and tackling for land purposes.

Coir rope from the cocoanut fibre is used for boats and ships running gear, and hawsers for cables, also for all tackling purposes when exposed to wet especially salt water.

Ropes made of *Crotalaria juncea*, are employed as tackling in dry places without exposure to wet.

A rope is made at Lahore of a fibrous plant called Chuyan, from Sunn Okra, others from the Dib and the Putta. Rope is also made at Lahore, from a fibre called Bugar, and ropes of palm leaves and of Dah grass and of plantain leaves.

Rope is made of Bail grass in Assam.

Rope from the *Urtica tenacissima* is made at Luckimpore.

Rope of *Saccherum moonja*, is made near the Ganges, Jumna and Indus. Twine is made from the fibre of the leaf sheath: a little thicker kind is used for towing boats; when dry it does not possess much strength, when wet it is strong and durable. The moonj is used for ropes, thatching, &c.

Twins and rope are made of *Crotalaria juncea*.

A rope is made at Batasore of Sealee fibre.

Rope of *Sterculia ramosa*, is made at Cut-tack.

Rope of rattan is made at Penang, Malay Peninsula, and is used for drawing water, and as halters for cattle.

Rope of bast is made at Burmah.

Rope of Mole, is made at Poonah.

Rope is made of Palmyra fibre, the *Borassus flabelliformis*.

The cotton rope of *Gossypium herbaceum* is made of cotton thread, and is used for hanging and pulling punkahs, and the ropes of all tents are made of it; it is considerably strong.

Ropes called Koombhee and Bunkuss are made at Lucknow.

A rope is made of the Phalsa tree bark, the *Grewia asiatica*.

A rope is made of 'Ghayal,' fibre at Poonah.

The principal cordage plants of British India are:—

Abelmoschus esculentus. *Acacia leucophloea*.

ROR. HIND. Pji. kunkur, or broken brick, for gravel.

RORI, HIND. A tree of Chota Nagpore, with hard, white timber.—*Cal. Cat. Ex.* 1862.

RORI. A town in Sind on the left bank of the Indus close to the ancient Alor. Bukkur is a fortified island in the Indus river. It is in the centre of the stream, nearly opposite the town of Rori and on the western bank is Sukkur, now called Victoria on the Indus. Near these places is the site of Arore, or Alores, the capital of Sind in remote antiquity: but a bridge over the stream which branched from the Indus, near Dura, is almost the sole vestige of this capital of the Sogdi of Alexander: On its site, the shepherds of the desert have established an extensive hamlet; it is placed on a ridge of siliceous rock, seven miles east of the insular Bukkur and free from the inundations of the Indus. The Soda tribe, a powerful branch of the Pramara race, has ruled in these countries from remote antiquity, and, to a very late period, they were lords of Omra-Soomra in which division was Arore. According to Burton, however, the site of Arore is four miles east of the Indus at Sukkur and Rori. Sehl and his capital were known to Abul Fazil, though he was ignorant of its position, which he transferred to Debeil, or Dewul, the modern Tatta. This indefatigable historian thus describes it, "In ancient times there lived a raja named Sehris (Sehl), whose capital was Alores, and his dominions extended north to Cashmere and south to the ocean." Sehl, or Sehr, became a titular appellation of the country, its princes, and its inhabitants, the Sehrai. Alores appears to have been the capital of the kingdom of Sigertis, conquered by Menander of Bactria. Ibn Haukul, the Arabian geographer, mentions it, but a superfluous point in writing has changed Arore into Azore, or Azour, as translated by Sir W. Ouseley. D'Anville mentions it, but, in ignorance of its position, quoting Abulfeda, says, in "grandeur Azour est presque comparable a Mooltau.

Rori is sometimes distinguished as Rori Bukkur; in Asia when a locality is designated by two names mentioned together, it is either because there are two places bearing these names respectively close to each other, as Hoti Mardan; Taru Jabba; or else, where there is a river, because they are on the opposite banks of the river, as Rori-Bakar, Thut-Naka, Daghi-Banda, etc.

RORI BAROLLI, the grand temple of Barolli is fifty-eight feet in height, and in the ancient form peculiar to the temples of Siva. The body of the edifice, in which is the sanctum of the god, and over which rises its pyramidal sikr, is a square of only twenty-one feet; but the addition of the domed vestibule (munduf)

and portico makes it forty-four by twenty-one. The whole is covered with mythological sculpture, without as well as within, emblematic of Siva, as Mahadeo, who is the giver, as well as the destroyer, of life. In a niche outside, to the south he is armed against the Dytes (Titans,) the round mala or skull-chaplet reaching to his knees, and in seven of his arms are offensive weapons. His cap is the frustrum of a cone composed of snakes interlaced with a fillet of skulls: the cupra is in hand; and the victims are scattered around. On his right is one of the maids of slaughter, Jogini, drunk with blood, the cup still at her lip, and her countenance expressive of vacuity; while below, on the left is a female personification of death, mere skin and bone: a sickle (koorpi) in her right hand, its knob a death's head, completes this group of the attributes of destruction.

To the west is Mahadeo under another form, a beautiful and animated statue, the expression mild, as when he went forth to entice the mountain-nymph Mera, to his embrace. His tiara is a blaze of finely executed ornaments, and his snake-wreath, which hangs round him as a garland, has a clasp of two heads of Sehesnag (the serpent-king,) while Nanda below is listening with placidity to the sound of the dumdoo. His cupra and karg, or skull cap, and sword, which he is in the attitude of using, are the only accompaniments denoting the god of blood. The northern compartment is a picture disgustingly faithful of death and its attributes, vulgarly known as Bhooka Mata, or the personification of famine, loud and bare; her necklace, like her lords, of skulls. Close by are two mortals in the last stage of existence, so correctly represented as to excite an unpleasant surprise. The outline is anatomically correct. The mouth is half open and distorted, and although the eye is closed in death, an expression of mental anguish seems still to linger upon the features. A beast of prey is approaching the dead body; while by way of contrast, a male figure, in all the vigour of youth and health, lies prostrate at her feet.

Such is a faint description of the sculptured niches on each of the external faces of the mindra, whence the spire rises, simple and solid. In a hindoo temple is the mindra or cella, in which is the statue of the god; then the munduf, in architectural nomenclature, is the pronaos and third, the portico. Like all temples dedicated to Bal-Siva, the vivifier, or 'sun god,' it faces the east. The portico projects several feet beyond the munduf, and has four superb columns in front. The ceilings both of the portico and munduf, are

elaborately beautiful: that of the portico, of one single block, could hardly be surpassed the exterior is a grand, wonderful effort of the silpi or architect, one series rising above and surpassing the other, from the base to the urn which surmounts the pinnacle. The sanctum contains the symbol of the god, whose local appellation is Rori Barolli, a change from Bal-rori, from the circumstance of Balnath, the sun god, being here typified by an orbicular stone termed rori, formed by attrition in the chooli or whirlpools of the Chumbul, near which the temple stands, and to which phenomena it probably owed its foundation. This symbolic rori is not fixed, but lies in a groove in the internal ring of the Yoni; and so nicely is it poised, that with a very moderate impulse it will continue revolving while the votary recites a tolerably long hymn to the object of his adoration. The old ascetic, who had long been one of the zealots of Barolli, amongst his other wonders, gravely told Col. Tod that with the momentum given by his little finger, in former days, he could make it keep on its course much longer than now with the application of all his strength.—*Tod's Rajasthan, Vol. II, pp. 706 and 708. Burton's Scinde, Vol. I, p. 166. Pers. Observ. p. 30.*

Gul; Gulab-ka-Jhar,	HIND.		

The rose-tree grows in India, both wild and cultivated, and its flower is much prized.

One or more wild yellow roses are found in Kashmir, Lahoul, Tibet, &c., Lowther states that they are sometimes double, and Thomson mentions double yellow roses at 11,000 feet in Ladak. The yellow Persian rose finds its eastern limit in Lahaul. Fortune says of the China Yellow rose and another that the gardens of the mandarins are extremely gay, particularly during the early months of the year, and contain a number of new plants of great beauty and interest. On entering one of the gardens on a fine morning in May he was struck with a mass of yellow flowers which completely covered a distant part of the wall. The colour was not a common yellow, but had something of buff in it which gave the flowers a striking and uncommon appearance. It was from a most beautiful new double yellow climbing rose. No doubt, from the more northern districts of the empire. Another rose, which the Chinese call the "five coloured" was also found in one of these gardens at this time.

It belongs to the section commonly called China roses in Great Britain, but grows in a very strange and beautiful manner. Sometimes it produces self-coloured blooms being either red or French white and frequently having flowers of both on one plant at the same time while at other times the flowers are striped with the two colours. This will be as hardy as the common China Rose. *Glycine sinensis* is often grown in China on a flat trellis in front of the summer house or forms a kind of portico, which affords a pleasing shade.—*Fortune's Wanderings, page 311. Dr. Cleghorn's Punjab Report.—Dr. J. L. Stewart.*

This fine wild white rose climbs luxuriantly over bushes and even tall trees. Is common in the outer Himalaya from 2,400 to 7,000 feet, up to and probably beyond the Indus. It furnishes a small sized wood, which makes walking sticks. In Murree they call it "chal;" but this they also apply to the jasmine.—*Dr. Cleghorn.—Dr. J. L. Stewart.*

ROSA CANINA.

Kin-Ying-tsze CHIN. | Dog-rose ENG.

Common in Kiang-si, Hu-pu and other provinces of China, fruits large and astringent formerly used in medicine.

ROSA CENTIFOLIA. *Linn.*

R. provincialis, <i>Müller.</i>	R. centifolia muscosa,
Wurd... ..	AR.
Gulab-ka-phul...	DUKH.
Cabbage Rose...	ENG.
Hundred leaved Rose ..	FERF.
	Gul; Gul-i-sad-barg

This, a native of Syria, is cultivated throughout Europe, British India, Persia and China, and from it, rosewater and attar or otto of roses are prepared. The stem or Kubyak is used by the hindoo physicians in medicine. Its fragrance is but partially destroyed by desiccation, and according to M. Chereau if remarkably augmented by iodine. It is less astringent than the Provence rose, and more laxative. The petals are used as laxatives for children, and also made into the conserve of roses or gul-khand.

The petals of this as well as of the *R. gallica* are preserved with salt by the European apothecaries for the preparation of the distilled

water.—*O'Shaughnessy. Dr. J. L. Stewart, Powell's Hand Book, Vol. I. p. 347.*

ROSA DAMASCENA. Mill.

Damask Rose ... ENG.

Cultivated in gardens in India for the sake of its flowers, it is supposed to have been originally brought from Damascus, and to be a native of Syria. It has many varieties. The essential oil of the petals sells at 2 rupees per tola.

ROSA EGLANTERIA. L. Native country unknown.

ROSA GALLICA.

French Rose. | Provence red rose.

Gul..... HIND.

This is supposed to be the species to which Pliny refers ('Hist. Nat.,' xxi. 18, 25, 72, 73). It is a native of Persia, found wild about Montalbanum, Walzenberg, and Geneva, in Austria. Piedmont, and the Caucasus; it has equal small prickles, erect flowers, ovate sepals and globose fruit. Hundreds of varieties of this rose are found cultivated in gardens. A great number of varieties of them are hybrids between *R. gallica* and *R. centifolia*. They mostly combine the long graceful shoots of the latter with the rich crimson hues of *R. gallica*. Hybrids are also produced between *R. gallica* and *R. indica*, but differ from the last in not being perpetual. The petals contain tannic and gallic acid, essential oil, oxide of iron, and other unimportant principles. The petals are gathered before becoming quite ripe, they are deprived of the calyx and central attachments, and dried before the sun or in a stove. When dried they are sifted in order to separate the stamina and pistil. They are then gently compressed and kept in a dry place. From the cabbage rose, a variety of this species, a very fragrant distilled water is prepared in England.—*O'Shaughnessy, page 326.*

ROSA GLANDULIFERA, is the Gul-eoti or Sewati of the Punjab.

ROSA INSERTA is the Nasrin kubjak.—*Powell's Hand-Book, Vol. I. p. 347.*

This plant grows over a wide range in the N. W. Himalaya up to the Indus from 4,500 to 10,500 feet. Its fruit is eaten, and is stated by Madden to become very sweet when black and rotten. In Kanawar, a perfume is extracted from the flowers for export towards the plains. This great red rose is one of the most beautiful Himalayan plants. Its single flowers are as large as the palm of the hand.—*Hooker's Him. Jour. Vol. II. p. 43. Dr. Cleghorn's Punjab Report. Dr. J. L. Stewart's Punjab Plants.*

ROSA MALLOS. ANGLO-BURM. for Rosa Mala. See Rose Maloes.

ROSA MOSCHATA, the Musk-Rose is found native in the north of Africa, and in the temperate and warm provinces of Spain.

ROSA PROSTOLISTATA. See Kabul.

ROSA RUBIGINOSA. Sweet-briar, or gulanarin, is met with in many Indian gardens—it sometimes blossoms, if budded on the Persian rose stock. The general mode of propagation is by layers, but a much quicker and easier method is to bud it on the stock of a rose. Tenasserim residences are often filled with sweet odours from the graceful eglantine, or sweet briar, but the plant is kept alive with difficulty when exposed to the south-west monsoon.—*Mason. Riddell.*

ROSA SEMPERFLORENS.

Yueh-ki-hwa CHIN.

The Chinese monthly rose, a common scrambling shrub bearing a regular profusion of red flowers, mostly barren, but used medicinally.—*Smith.*

ROSA SERICEA, is an erect white flowered rose, and is the only species occurring in southern Sikkim. It is very abundant: its numerous inodorous flowers are pendent, apparently as a protection from the rain, and it is remarkable as being the only species having four petals, instead of five.—*Hooker's Him. Journ. Vol. I. p. 168.*

Kantyan.....	KAGHAN.	Kugina.....	

This rose is found chiefly in the rather arid tracts of the Punjab Himalaya from 5,000 to 9,500 feet, up to near the Indus, and in Ladak it reaches 13,500 feet. Its fruit is eaten, and in parts of Spiti the stems are largely used for fuel.—*Drs. Cleghorn and J. L. Stewart.*

ROSARIES.

Tasbih AR. HIND. PERS.	Rosario.....	IT.
Rosniro.....	FR.	Rosaro.....
Rosenbeet; Rosenkrans	GER.	

Rosaries are used by christians, mahomedans and hindus. The mahomedans, as each bead passes through their hands, recite one of the hundred attributes of the Creator. The thousand names of Vishnu and Siva are strung together in verse, and are repeated on certain occasions by brahmans, as a litany accompanied sometimes with the rosary. As each name is mentally recited, with the attention abstractedly fixed on the attribute or character, of which that name excites the idea, a bead is dropped through the finger and thumb: such operation is supposed to assist or promote

abstraction, an attainment which enthusiastic hindus think exceedingly efficacious. Brahmans and pious men of other castes, are often seen with rosaries in their hands. These are composed of amber or of the rough seeds of fruits which are sacred to the gods. Images and pictures of Brahma, and of Siva, are frequently seen, with a rosary in the hand, and the hand is sometimes seen enclosed in a loose bag. There is no authority for supposing that the Jews or the earlier Christians used rosaries.—*Moor's Pantheon*, p. 24.

The flowers of the rose have a great variety of colours from the deep red to pale yellow and white with every intermediate shade. In India, the easiest mode of propagation is by layers at almost all seasons, or by cuttings at the commencement of the rains. The Persian varieties, red and white, require to have their roots opened, and the plants cut during the early part of the cold season, after which they must be watered well every second or third day. The roots must then be covered up with manure, when they will throw out flowers. The Rose Edward, which blossoms great part of the year, requires pruning about a month after it ceases to blossom, and should be allowed to rest a short time without watering, when a fresh supply of water and manure round the roots will cause it to bear flowering shoots immediately. This rose, and the Egyptian, are amongst the few that give seed-hips, being perfectly formed on both. Some of the roses in China are peculiar from having transparent dots on their leaves, resembling those of the myrtles, and with the Chinese, the roots and fruits of rose trees are official.—*Smith. Riddell*.

ROSE APPLE. *Eugenia-jambos*.

ROSE ATTAR.

Atr...ARAB. HIND. PERS. | Otto.....Eng.

In India, the perfumed oils or attar are obtained in the following manner. The layers of the jasmine, or other flowers, four inches thick and two inches square, are laid on the ground and covered with a layer of sesamum or any other oil-yielding seed. These are laid about the same thickness as the flowers, over which a second layer of flowers like the first is placed. The seed is wetted with water, and the whole mass covered with a sheet, held down at the ends and sides by weights, and allowed to remain for eighteen hours in this form. It is now fit for the mill, unless the perfume is desired to be very strong, when the faded flowers are removed and fresh ones put in their place. The seed thus impregnated is ground in the usual way in the mill and the oil expressed, having the scent of the flower. At Ghazipoor the jasmine and bela are chiefly employed ; the oil is kept in the bottles of hide, called dubber, and sold for about 4s. a seer. The newest oils afford the finest perfume. In Europe a fixed oil, usually that of the bean or moringa nut, is employed. Cotton is soaked in this, and laid over layers of flowers, the oil being squeezed out so soon as impregnated with perfume. Dr. Jackson thus describes the culture of the rose in India and manufacture of rose-attar or rose water. Around the station of Ghazipoor, there are about 300 biggahs (or about 150 acres) of ground laid out in small detached fields as rose gardens, most carefully protected on all sides by high mud walls and prickly pear fences, to keep out the cattle. These lands, which belong to zemindars, are planted with rosé trees, and are annually let out at so much per biggah for the ground, and so much additional for the rose plants—generally five rupees per biggah and twenty-five rupees for the rose trees, of which there are 1,000 in each biggah. The additional expense for cultivation would be about eight rupees, eight annas ; so that for thirty-eight rupees, eight annas you have for the season one biggah of 1,000 rose trees. If the season be good, this biggah of 1,000 rose trees should yield one lac of roses. Purchases for roses are always made at so much per lac. The price of course varies according to the year, and will average from 40 to 70 rupees. The rose trees come into flower at the beginning of March, and continue so through April. Early in the morning the flowers are plucked by numbers of men, women and children, and are conveyed in large bags to the several contracting parties for distillation into rose-water. The cultivators themselves very rarely manufacture. The native apparatus for distilling the rose-water consists of a large copper or iron boiler well tinned

capable of holding from eight to twelve gallons, having a large body with a rather narrow neck, and a mouth about eight inches in diameter; on the top of this is fixed an old pot or degh-chee, or cooking vessel, with a hole in the centre to receive the tube or worm. This tube is composed of two pieces of bamboo, fastened at an acute angle, and it is covered the whole length with a strong binding of corded string, over which is a luting of earth to prevent the vapour from escaping. The small end, about two feet long, is fixed into the hole in the centre of the head, where it is well luted with flowers and water. The lower arm or end of the tube is carried down into a long-necked vessel or receiver, called a bhulka. This is placed in a pot of water, which, as it gets hot, is changed. The head of the still is luted on to the body, and the long arm of the tube in the bhulka is also well provided with a cushion of cloth, so as to keep in all vapour. The boiler is let into an earthen furnace, and the whole is ready for operation. There is a great variety of rose-water manufactured in the bazar, and much that bears the name, is nothing more than a mixture of sandal oil. The best rose-water, however, procurable in the bazar, may be computed as bearing the proportion of one thousand roses to a seer of water; from one thousand roses most generally a seer and a half of rose-water is distilled, and perhaps from this even the attar has been removed. The boiler of the still will hold from eight to twelve or sixteen thousand roses. On eight thousand roses from ten to eleven seers of water will be placed, and eight seers of rose-water will be distilled. This, after distillation, is placed in a carboy of glass, and is exposed to the sun for several days to become pukka or ripe; it is then stopped with cotton, and has a covering of moist clay put over it: this becoming hard, effectually prevents the scent from escaping. This is the best that can be procured, and the price will be from twelve to sixteen rupees.

To procure the attar, or otto of roses, the roses are put into the still, and the water passes over gradually, as in the case of the rose-water process; after the whole has come over, the rose-water is placed in a large metal basin, which is covered with wetted muslin, tied over to prevent insects or dust getting into it; this vessel is let into the ground about two feet, which has been previously wetted with water, and it is allowed to remain quiet during the whole night. The attar is always made at the beginning of the season, when the nights are cool; in the morning the little film of attar which has formed upon the surface of the rose-water during the night is removed by means of a feather, and carefully placed in a small phial; and, day after

day, as the collection is made, it is placed for a short period in the sun, and after a sufficient quantity has been procured, it is poured off clear, and of the colour of amber, into small phials. Pure attar, when it has been removed only three or four days, has a pale greenish hue; by keeping, it loses this and in a few weeks' time it becomes of a pale yellow. The first few days distillation does not produce such fine attar as comes off afterwards, in consequence of the dust or little particles of dirt in the still and the tube being mixed with it. This is readily separated from its sinking to the bottom of the attar, which melts at a temperature of 84 degrees. From one lac of roses it is generally calculated that 180 grains, or one tolah of attar can be procured; more than this can be obtained if the roses are full-sized, and the nights cold to allow of the congelation. The attar purchased in the bazar is generally adulterated, mixed with sandal oil or sweet oil; not even the richest native will give the price at which the purest attar alone can be obtained, and the purest attar that is made is sold only to Europeans, selling at from 50 to 90 rupees the tolah.

In India, Native stills are let out at so much per day or week, and it frequently occurs that the residents prepare some rose-water for their own use as a present to their friends, to secure their being provided with that which is the best. The natives of India never remove the calices of the rose-flowers, but place the whole into the still as it comes from the garden. The best plan appears to be to have these removed, as by this means the rose-water may be preserved a longer time, and is not spoiled by the acid smell occasionally met with in the native rose-water. It is usual to calculate 100 bottles to one lac of roses. The rose-water should always be twice distilled; over ten thousand roses water may be put to allow of sixteen or twenty bottles coming out the following day; these twenty bottles are placed over eight thousand more roses, and about eighteen bottles of rose-water are distilled. This may be considered the best to be met with. The attar is so much lighter than the rose-water, that previous to use, it is better to expose the rose-water to the sun for a few days, to allow of its being well mixed; and rose-water that has been kept six months is always better than that which has recently been made. At the commencement of the rose season, people from all parts come to make their purchases, and very large quantities are prepared and sold. There are about thirty-six places in the city of Ghazee-pore where rose-water is distilled. These people generally put a large quantity of sandal oil into the receiver, the oil is afterwards carefully removed

and sold as sandal attar, and the water put into carboys and disposed of as rose-water. At the time of sale a few drops of sandal oil are placed on the neck of the carboy to give it fresh scent, and to many of the natives it appears perfectly immaterial whether the scent arise solely from the sandal oil or from the roses. Large quantities of sandal oil are every year brought up from the south of India and expended in this way.

The chief use the natives appear to make of the rose-water, or the sandal attar as they term it, is at the period of their festivals and weddings. It is then distributed largely to the guests as they arrive, and sprinkled with profusion in the apartments. A large quantity of rose-water is sold at Benares, and many of the native rajahs send over to Ghazipoor for its purchase. Most of the rose-water, so soon as distilled, is taken away, and after six months from the termination of the manufacture there are not more than four or five places where it is to be met with. The value of the roses sold for the manufacture of rose water may be estimated at 15,000 to 20,000 rupees a year; and from the usual price asked for the rose-water, and for which it is sold, there may be a profit of 40,000 rupees. The natives are very fond of using the rose-water as medicine, or as a vehicle for other mixtures, and they consume a good deal of the petals for the conserve of roses, or gool-kand as they call it. The delightful fragrance from the Ghazipur rose fields can be scented at seven miles distance on the river Ganges. The most approved mode of ascertaining the quality of attar is to drop it on a piece of paper; its strength is ascertained by the quickness with which it evaporates, and its worth by its leaving no stains on the paper. The best otto is now manufactured at Constantinople, and it is largely made in France.—*O'Shaughnessy, p. 326.*

This is made near Ghazipur but is very largely imported into India from the south of France. See Rose.

ROSETTA STONE. A stone discovered on the redoubt of the town of Reshid, by an Artillery Officer of the French army in August 1799. It was a dark syenitic basalt and contained an inscription, the upper part in hieroglyphics the lower in Greek. It was first, in part, translated in 1813 by Dr. Thomas Young a physician of Great Britain.

ROSETTA-WOOD is a good sized, East India wood, imported into Europe in logs 9 to 14 in diameter ; it is handsomely veined ; the general colour is a lively red-orange (like the skin of the Malta orange) with darker marks, which are sometimes nearly black ; the wood is close, hard, and very beautiful when first cut, but soon gets darker.—*Holtz.*

ROSE-WATER.

Siang-wei-lu, ... CHIN. | Ayar mawar MALAY.
Gul-ab-ka-pani Guz. HIND. | Ab-i-gul PERS.

The water distilled from roses, and put for sale into large glass bottles of about three imperial gallons capacity each, called carboys. A large quantity is annually exported from the Persian Gulf to Bombay ; that sold in Benares is obtained from Gazeepore, where it is largely distilled. Rose-water is much esteemed on account of its great fragrance, and is chiefly used by the natives at the periods of their festivals and weddings. See Rose.

Like to iron-wood, blackwood, redwood, &c., rose-wood is a commercial term given to the timbers of several trees. That used in Britain, is produced in the Brazils, the Canary Isles, the East Indies, and Africa. It is imported in very large slabs, or the halves of trees which average 18 inches wide. The best is from Rio de Janeiro, the second quality from Bahia, and the commonest from the East Indies : the latter is called East India black-wood, although it happens to be the lightest and most red of the three ; it is devoid of the powerful smell of the true rose-wood, which latter Dr. Lindley considers to be from a species of mimosa. The pores of the East India Rose-wood appear to contain less or none of the

resinous matter, from which the odour, like that of the flower of *Acacia armata*, arises. One of the rose-woods contain so much gum and oil, that small splinters make excellent matches. The colours of rose-wood are from light hazel to deep purple, or nearly black : the tints are sometimes abruptly contrasted, at other times striped or nearly uniform. The wood is very heavy ; some specimens are close and fine in the grain, whereas others are as open as coarse mahogany, or rather are more abundant in veins. The black streaks are sometimes particularly hard, and very destructive to the tools employed on it. Next to mahogany, it is, in England, the most abundant of the furniture woods. A large quantity is cut into veneers for upholstery and cabinet work, and solid pieces are used for the same purposes and for a great variety of turned articles of ordinary consumption. Mr. Poole, in his *Statistics of Commerce*, describes it as a highly esteemed dark brown colored, fancy wood, principally used in veneering and making costly furniture. That delivered in England, he says, is imported chiefly from Bahia and Rio de Janeiro, into London and Liverpool. It is in the form of the halves of trees averaging 18 inches wide, and in height $2\frac{1}{2}$ cwt., called planks, of which the import in 1851 was 2,000 tons. Price, ordinarily, £9 to £19 but rising occasionally to £90 per ton. The rosewood of the Tenasserim provinces, is a very beautiful, hard, compact timber, resembling "Andaman wood," and is occasionally seen in the bazar of Calcutta. From Siam, and other places, a rosewood is largely exported by the Chinese. These woods are generally esteemed according to the degree in which the darker parts are distinct from the purple red, which form the ground.

One Rose-wood, is *Lignum Rhodium*, *Aspalathus*, whence the *Oleum Rhodii* is obtained, heavy, oleaginous, somewhat sharp and bitter to the taste, of a strong smell, and purple colour. The *Chinese Rose-wood*, called Tze-tau, is odorous, of a reddish black colour, streaked, and full of fine veins, which appear as if painted. The manufactures of this wood are more valued in China than the varnished or japanned. There are baser kinds of Rose-wood of inferior value. *East Indian Black-wood* or *Rosewood*, from the *Dalbergia latifolia* is an excellent heavy wood, suited for the best furniture. It can be procured in large quantities, and of considerable size ; the wood contains much oil. In large panels it is liable to split.—*Faulkner's Commercial Dictionary*. *The Hon'ble Mr. Morrison's Compendious Description*. *M. E. The Rosin, or Common Resin of Europe, is obtained as a residuary matter in the process for obtaining the oil of turpentine. Turpentine is oleo-resins. In their natural state they are either solid or semi-fluid, the oil of turpentine being obtained by distillation of American turpentine with water, and is from the *Pinus palustris*; partly also from the *Pinus tæda*, and perhaps some other species inhabiting the southern states, from North Carolina and the south-eastern part of Virginia. A hollow is cut in the tree a few inches above the ground, and the bark removed for the space of about eighteen inches above it. The turpentine runs into this excavation from about March to October; more rapidly, of course, during the warmer months. It is transferred from these hollows into casks. Old and concrete American turpentine is often sold as frankincense.

Sir Richard Jenkins in his report on the Nagpore Territory, states, that the rall or rosin tree, as also other large wood is obtained in the forests of Kakair. (probably Conkair) and in the hills north of Rutenpore, said to be a tree of large growth, and bearing some resemblance to the Saul: in the Pachmurra Range, a tree of the Saul family, is the "*Vatica tumbuggaia*" which the natives say furnishes a frankincense. This is probably the rall tree, though it does not in those jungles attain a large size. See Dammar; Gugalam; Gums and Rosins.

It is called the monkey faced tree, from these animals rubbing their faces with the fruit. It is a large tree with alternate, ovate oblong leaves, of a ferruginous colour beneath ; flowers in the cold weather. Fruit size of a pea, covered with a red mealy powder, used as a dye. The tree is common in many parts of British India; the stellate pubescence covering the 3-coccous capsule of this large tree, is collected for sale in Mysore, where it is used for dyeing silk an orange colour. The colouring matter does not require a mordant, all that is necessary being to mix it, with water, containing about half its weight of carbonate of soda. On silk, the colour is a rich flame or orange tint of great beauty and extreme stability ; and the fact that the material supplied by commerce, contains between 70 and 80 per cent of real colouring matter, ought to induce silk dyers to turn their attention to it. Ainslie describes it as a fine, reddish brown, light powder, which the Natives employ for dyeing a beautiful pale orange colour : it is the red dust shaken from the dry fruit and is an export from Malabar. Dr. Honigberger mentions that the Kamila or Kamud of the Lahore bazar is taken to Lahore from the hills, in the form of coarse red powder. In Ajmir the dust from the capsule of the fruit, is used to dye silk yellow, alum being used as the

mordant : it is considered in medicine as of a warm nature, also anthelmintic and given to children in "dai." Three or four masseh are a dose also used in ointments for herpetic eruptions, price two and a half seers for one rupee. It contains a yellow resin, rottlerine, soluble in carbonate of soda and precipitated by acids. It acts as a purgative, and very sure anthelmintic in cases of tape-worm in doses of from one to two drachms. It is in some districts used as an application to cutaneous diseases, especially for itch and fevers, and it is said to be also a purgative medicine and aphrodisiac." The oil which is obtained plentifully from the kernels of this fruit after the removal of the celebrated powder, promises to be of some importance medicinally as a cathartic oil. The Rulya, which is made from it, contains 78 per cent of coloring matter, it consists of hairs obtained from the outer part of the capsules. The powder is attached to the fruit capsule, and when the fruit is ripe, it is brushed off and collected. It is also found sparingly on the leaves, petioles, and flower stalks of the plant. The powder is of a dark brick red colour, with a peculiar heavy odour increased on its being rubbed between the fingers. Two varieties of it are sold in the bazars in the Punjab, the one having been passed through coarse cloth to free it from impurities, such as portions of the withered flowers, dust or insects, but the only appreciable difference is that this finer quality is cleaner than the other. To cold water the powder does not impart its yellow colour, but either floats on the surface or falls in small quantities to the bottom. Boiling water becomes slightly tinged by it. If the powder is boiled in water to which any of the alkalies have been added, a complete solution of the colouring matter takes place, and it is by means of this property that the natives of India avail themselves of it as a dye. Alcohol and ether dissolve it with equal facility. All these preparations of the powder have a dark red colour, and the yellow colouring matter is only separated on the addition of certain re-agents. Thus, when the mineral acids are added to the alkaline decoction or infusion, a thick flocculent precipitate of a gamboge yellow colour is thrown down, and the same effect is produced on the alcoholic and etherial tinctures on the addition of water or the mineral acids. Contact with the atmosphere seems to cause the development of this yellow deposit, as on exposing on glass, a thin film of either of the tinctures, before evaporation of the fluid is completed, the previously transparent coating becomes opaque and of a light yellow colour. The process of dyeing seems also to bear on this idea, as silk or cloth is merely dipped in a hot alkaline solution which is of a dark red colour, and on the

drying of the cloth the characteristic yellow colour is developed. The resinous deposit, on which the active properties of the plant both as an anthelmintic and a dye depend, are obtained in a large quantity from an alkaline decoction of the powder by boiling eight ounces of the powder in two pints of water, along with one ounce of the bicarbonate of soda. Filter when cool, and to the filtered liquid add nitric acid till the solution becomes neutral. A considerable quantity of yellow matter then forms in the fluid, which is again filtered, and this yellow residue, when dry is found to weigh one and a half ounces; is of a dusky yellow colour, and adheres in lumps of considerable consistence. The substance probably exists in the plant as an essential oil, and the formation of the yellow coloured deposit, on the neutralization of alkaline solutions and the addition of water or the acids to the alcoholic and etherial solutions, or by the action of air, consists in the change of the essential oil to a resin, by the loss of hydrogen and the absorption of oxygen. In all parts of India the powder is extensively used as a dye, especially for silk, to which it imparts a fine yellow colour. It is also employed to dye cotton cloth. The following is the process of dyeing as pursued in Umritsir, the second city of the Punjab, where a large trade in silk is carried on. Barilla, a coarse preparation of carbonate of potash, obtained by burning a herbaceous species of *salsola* common in the uncultivated portions of the Punjab, is mixed with water, in the proportion of one ounce of barilla to four ounces of water. To this solution, when filtered, the kamila is added, and they are then boiled together. When the boiling has been continued long enough to extract all the colouring matter, a small quantity of lime is dissolved in the fluid. The dye is then ready for use, with the exception of the addition of few grains of alum, in order to fix the colour. In some parts of India, gum is occasionally mixed with fluid, but in the Punjab this is never considered necessary. The characteristic yellow colour is not developed in silk, &c. until after two or three immersions in the dyeing fluid. The kamila dye is sold in the drug mart of Umritsur at 18 Rs. a maund for the first quality, and 10 Rupees for the second. (This is at the rate of 2 lbs. for six pence). The drug is used by native practitioners made into an ointment as an external application in itch, and other skin disorders, and its use as a vermifuge is also known to them.—*Cteghorn's Punjab Report Kulu and Kangra*. p. 82. *The Ind. ROXANA, Alexander's queen, was a Turkoman woman. Alexander the Great's death occurred in the spring of the year 323 B. C. His empire though only of ten years' growth, was not transient. His colonies and their institutions, manners and language had a lasting action in Central Asia, the effects of which were felt for at least five hundred years after his decease. Though he left his brother

Aridæus and the posthumous child of Rashana or Roxana, called Alexander, neither of these succeeded him, for his military commandants, assumed sovereign power, and in B. C. 315 Antigonus assumed the regal title of king of Asia.

In B. C. 305, Seleucus gained a great victory over Nicator, a lieutenant of Antigonus, and followed it up by seizing and adding to his own government, the whole of Media, Hyrcania, Parthia, Bactria, and Aria, and all the countries as far as the Indus. In B. C. 303, he crossed that river to make war on Chandra Gupta, who, during these contentions had expelled the Grecian garrisons from the Panjab, and had so recovered that country for the native sovereigns of India. Seleucus being called to a final struggle with Antigonus made a hasty peace with Chandra Gupta, ceding the Panjab as far as the Indus. According to Strabo, Arachotia was also ceded, but this seems doubtful. Kuchchee to the Bolan Pass with the valley of the Indus may have been the region ceded. Seleucus drove Antigonus into Phrygia where he was defeated and slain in 301 B. C.

Seleucus[Nicator subsequently was assassinated in 280 B. C. by Ptolemy Ceraunus, from which date the whole of Asia to the Indus and Jaxartes was under the Syrian king Antiochus Soter, who from 280 to 261 B. C. reigned undisturbed over the same territory and left it to his son Antiochus Theus.

In 256 or 255 B. C., Bactria declared for independence under Theodotus or Decodotus.

Parthia followed about the year 250 B. C. under the rule of Arsaces, who is variously described as a native of Soghd, as a Bactrian, and, by Moses of Chorene, as of Balkh, this last author adding that the dynasty was known as Balkhavensis or Pahlavian. He used Greek only on his coins and in his public letters and correspondence; ordinarily with the head of the sovereign on one side; only one coin has a lingual inscription. Great king of kings was a title first adopted by Mithridates II.

ROXBURGH, WILLIAM, M. D. A medical officer of the Madras Army, in the service of the E. I. Company, who was their Botanist in the Carnatic, and subsequently in charge of the Gardens in Calcutta. He entered the Madras Service 1766, and died in 1815. He was author of Coromandel plants, and of the Flora Indica. The former work was published by the order of the E. I. Company in three folio volumes, under the direction of Sir Joseph Banks, Bart, in 1793 and 1795, with three hundred coloured plates, and was the first

contribution of the Indian Government to the illustration of botanical science. His Flora Indica remained in manuscript for some years after his death. Two editions of it have since been published since that period; one, which is incomplete, was edited by Drs. Carey and Wallich; it extends to the end of Pentandria Monogynia, but contains many additional plants not contained in Roxburgh's manuscript, the other, which is an exact reprint of the manuscript as left by its author, is in three volumes, and was published in 1832. He also published Hortus Bengalensis and Catalogue of the Calcutta Garden. He was the first to describe fully, accurately, and reduce to the form of Flora, according to the Linnean system, the riches of the East. During the earlier part of his career he resided in the Peninsula, particularly about Samulcottah, where he had ample opportunities of examining the botany of the neighbouring Circar mountains. In the autumn of 1793, from his great merit, he was removed to Calcutta, to undertake the superintendence of the Company's Botanic Garden there: here he remained till 1814, adding new descriptions to his manuscript, when "the illness which unhappily terminated in depriving the world of his labours, compelled him to undertake a voyage for the sake of his health, which he at first intended should have been only to the Cape. His declining state of health, however, induced him to proceed as far as St. Helena. During his stay in that island, he, ever attentive to the interests of science, improved the opportunity by describing most of the plants he found growing there. After his arrival in England, whether he was at length obliged to proceed, he entertained considerable hopes of being able to put the Flora Indica to the press; and once wrote to Dr. Carey of Serampore that, in preparing it for this purpose, he hoped to procure the assistance of Mr. Robert Brown. Death, however, soon prevented his accomplishing this object, which he had so much at heart." Dr. Carey and Dr. Wallich edited and published the first volume (including all from Monandria to the end of Tetrandria) in 1820; and the second (containing nearly all Pentandria-Monogynia) in 1824; both are enriched with many new species described by Wallich, no more of that edition has appeared, and afterwards his two sons induced Dr. Carey to bring out their father's book in three volumes. But not only did Dr. Roxburgh describe the plants he observed, but he had at the same time splendidly coloured drawings made of them. These, upwards of 2,000 in number, he presented to the East India Company: from them a selection of 3,000 was allowed to be made and ordered to be published by the

Court of Directors, under the superintendence of Sir Joseph Banks : this magnificent work, entitled the *Plants of Coromandel*, was commenced in 1795, and completed in 1816, in three enormous volumes.—*Wight's Prodromus Flora*, Vol. I. pp. 13, 14.

ROXBURGHIAEAE. Roxburgh-Worts, a natural order of Plants belonging to the class Dictyogens, natives of the hot parts of India. There is but one genus—*Roxburghia*, the roots of a species of which are prepared with lime water, candied with sugar, and taken with tea. The flavour is insipid. Dr. Wight gives *Roxburghia gloriosoides*. *Lindley, Vegetable Kingdom. Eng. Cyc.*

ROYAL OIL. The translation of Baal-Sheamen, the origin of the word Balsam.

ROYAPURAM. A district of Madras on the north side.

ROYLE. John Forbes, of the Bengal Medical Service; in charge of the Botanical Gardens, Seharunpore. Author of the Geographical description of the Flora of India, Rep. Brit. Ass. 1846, part 3, 74.—Illustration of the Botany, &c., of the Himalaya mountains, 1839. Productive resources of India. Lond. 1840.—On the Culture of Cotton in India. Lond. 1852, 1 vol. 8vo.—On the fibrous plants of India; Secretary of the Horticultural Society of London. Dr. Royle commenced his Indian career about A. D. 1818 and died in 1858. Shortly after his appointment as Assistant Surgeon on the Bengal Establishment, he was placed in charge of the Botanic Garden at Saharunpore, where he remained for nearly nine years. On his return to England in 1832 or 1833, he commenced the publication of his excellent work on the Botany of the Himalayan Mountains, which contains also an accumulation of valuable information respecting the economical, medicinal, and other vegetable products of India. In 1838 or 1839, he was appointed Botanical Adviser to the E. I. Company, after which he published a work on the Productive Resources of India, which contains a great amount of useful information culled from various sources, combined with his own experience and research and in 1851, a work on "the culture and commerce of Cotton in India and elsewhere."

On the breaking out of the Russian war in 1853, Dr. Royle wrote on The fibrous plants of India fitted for cordage, clothing, and paper, which attracted much attention on its publication in 1855.

In addition to these, Dr. Royle published on the Antiquity of Hindoo Medicine; an Essay on Medical Education; a Manual of Materia Medica and Therapeutics; besides contributions to other publications, such as Kitto's

Cyclopædia of Biblical Literature, Holtzapffel's Turning and Mechanical Manipulation, to the Catalogue of the Great Exhibition of 1851, and very shortly before his death, a pamphlet, reviewing the measures which have been adopted in India for the improved culture of cotton. The districts investigated by Dr. Royle, and by his collectors were chiefly the Jumno-Gangetic Doab the upper part of the Gangetic plain, and the mountains of Garhwal, Sirmur, Kanawer, and Kashmir. His Illustrations of the Botany of the Himalayan Mountains, in two volumes quarto, with 100 plates, is still the only book except Dr. Wallich's *Tentamen Floræ Nepalensis*, devoted to the rich flora of the mountains; and it further contains the first and only attempt to demonstrate the prominent features of the geographical distribution of Northern Indian plants in reference to the elevations and climates they inhabit, and to the botany of surrounding countries.—*Hooker and Thomson's Flor. Indica. Indian Field.*

ROYLEA ELEGANS. Wall.

Ballotta cinerea, D. Don. | *Phlomis calycina*, Roxb.

A shrub of the Himalaya valleys with small white pale rose coloured flowers. It is deemed a febrifuge, by the people of the Himalaya, like some species of *Tenacium* in Europe.—*O'Shaughnessy*, p. 492. *Voigt*.

ROUZAT-UL-ATHAR, the title of work by a mahomedan author.

Indian madder or munjistha, the *Rubia cordifolia*, has white flowers. It is a native of Siberia, is cultivated largely in the East, particularly in Assam, Nepal, Bombay, Sind, Quetta, China, &c., for its dye-stuff. A small quantity is exported from China and India about 338 indian maunds were shipped from Calcutta in 1840, and 2,328 in 1841. It fetches in the London and Liverpool markets from 20s. to 25s. and 30s. per cwt., duty free; 405 tons were imported into Liverpool from Bombay and Calcutta, in 1849, and 525 tons in 1850, but none was imported in 1851 and 1852. In 1851, at the Great Exhibition, the jury remarked that some of the colors dyed with it are quite as permanent as those dyed with madder and even more brilliant botanists have been inclined to regard *R. cordifolia* and *R. munjistha* as distinct and in habit, form of stem, &c.; there are differences sufficient to make them distinct species. *R. munjistha*, Dr. Gibson observes, is not such a large climber as the other; Bancroft, was informed by Dr. Roxburgh that the stem of *R. munjistha* unlike the stem of *R. tinctorum*, seemed to be preferred to the roots for dyeing; Roxburgh in his *Flora Indica*, adds that, not only the roots and the stems, but the large branches also are used to dye red with. Munjeet is brought into India from the west, as well as from Nepal. It is imported into Bombay, of an apparently inferior quality, from Muscat, and into the Punjab from Afghanistan, forming a considerable part of the large annual investments of the Loshanee merchants. From the Punjab, as well as from Afghanistan direct, it goes to Sind, and thence to Bombay, where it realizes 40 per cent. more than the Muscat article, and is exported to England. It is extensively used in the Punjab, in Sind, and in the North Western Provinces, as a dye stuff, and is found in every bazaar of any extent. Into Umriraur

alone, upwards of 10,000 maunds were imported in the year ending 30th April 1855-56, and existing stocks must have been large, as in the same year the dealers exported more than 22,000 maunds, or upwards of 700 tons, valued at about Rs. 200,000.

The munjeet brought from Afghanistan answers exactly to the description given in *Ure's Dictionary of Arts*. It is either the true madder of Europe or is produced by a species of *rubia* found in almost all parts of India distinct from *R. manjista*.

The Nepal munjeet is valued in Calcutta at from Rs. 5-0 to 5-2 per maund, while the Afghan article realizes 8-4 per maund in Bombay. The Calcutta retail price is from 8 to 9 Rupees a maund. The price of Calcutta munjeet, in London, is from 7-8 to 17 Rupees per cwt. or 5-15 rupees per maund. Of French madder, at Marseilles, 15 to 18 Rupees per maund. 3,897 cwt. were imported into England from Calcutta, in the three years ending 1822, while 4,023 cwt. were imported in 1824. The trade fell off again to an average of 1,179 cwt. for the three years ending 1840, or 180 tons for the three years. The consumption of madder in England, in 1852, was 4,200 tons, and of madder roots 8,800 tons. In 1832 it was 3,000 tons of madder, and 2,500 tons of madder roots, showing an increase of 1,200 tons of the one, and of six thousand three hundred tons in twenty years.

Munjeet, to the extent of Rs. 68,941, representing about 7,000 maunds, was exported in 1855-56 from the port of Kurrachee, while in 1856-57, the export of the same article had increased by 539 per cent. to the value of Rs. 4,40,552, representing upwards of forty thousand maunds, or thirteen hundred tons. The larger portion of this large quantity must be conveyed direct from Afghanistan by Kilat or the Bolan Pass to Sind.

An infusion of it is given as a grateful and strengthening drink, to weakly women after lying in. Camel loads of madder are brought from Banu and Touk, on the west side of the Indus, to Lahore.—*Mason. Irvine. Ains. Mac-Mech.*, p. 82. *Dr. Honig. Thirty-five years in the East*, p. 337. *Mr. Henry Cope in the Indian Field*, 3rd May 1858. See Madder.

RUBIA CORDATA is used in Japan by the country people for dyeing, in like manner as madder (*Rubia tinctorum*) is in Sweden.—*Thunberg's Travels*, Vol. III., p. 63.

RUBIA MUNJITH. *Desv. Syn.* of *Rubia cordifolia*.—*Linn.*

RUBIA SECUNDA. *Moon. Syn.* of *Rubia cordifolia*.—*Linn.*

RUBIA TINCTORUM. Madder.

Madder... ..Eng. | Menjithe ...HIND.

Madder is the product of the *Rubia tinctorum*, and was employed in medicine even in the time of Hippocrates, but is valued chiefly as a dye. The tree has a diffuse brittle-branched stem, angular, very rough, with sharp hooks; leaves 4 or 6 in a whorl, lanceolate or oblong-lanceolate, mucronate, somewhat membranous with pinnated veins; flowers small and white; lobes of the corolla ovate-lanceolate, apiculate; anthers ovate-oblong; stigmas conical. It is a native of Europe and Asia Minor, is extensively cultivated in Holland and France; the culture has likewise been attempted, and successfully in Great Britain, but the English madder could not be sold so cheap as the foreign; it is therefore still largely imported, chiefly from Holland, France, Italy, and Turkey, though, since cochineal has become cheaper, it is much used for the same purposes. It is employed by dyers and calico-printers as a red and scarlet dye. It has also the singular property of turning red the bones and secretions of fowls and other animals fed on it.

Madder is the product of the long slender roots of the *Rubia tinctorum*, a plant of which there are several varieties. The principal supplies are obtained from Holland, Belgium, France, Turkey, Spain, and the Balearic Isles, the Italian States, India, and Ceylon. The plant is generally raised from seed, and requires three years to come to maturity. It is, however, often pulled in eighteen months without injury to the quality; the quantity only is smaller. A rich soil is necessary for its successful cultivation, and when the soil is impregnated with alkaline matter, the root acquires a red color; in other cases it is yellow. The latter is preferred in England, from the long habit of using Dutch madder, which is of this color, but in France the red sells at two francs per cwt. higher, being used for the Turkey-red dye. Madder does not deteriorate by keeping, provided it be kept dry. It contains three volatile coloring matters, madder purple, orange, and red. The latter is in the form of crystals, having a fine orange red color, and called Alizarin. This is the substance which yields the Turkey-red dye. The roots are creeping, the thickness of the little finger, very long and branching, provided with numerous articulations, and tough fibrils, epidermis thin, pale brown, bark and medullium intensely red. The odour is weak and peculiar, taste bitter and styptic. According to Kuhlman's analysis the roots contain red colouring matter, (Alizarin, Robiquet,) yellow do, (Xanthine,

Kuhl.) woody fibre, mucilage, gum, sugar, bitter matter, resin, salts, albumen, &c. Alizarin occurs in orange red crystals, tasteless, inodorous, little soluble in cold, but soluble in boiling water also in alcohol, ether, the fixed oils, and alkalies. The alcoholic solution is rose coloured, the ethereal golden, the alkaline violet or blue. A solution of alum added to a solution of alizarin, and precipitated by potash, gives a rose lake of the most charming tint. Xanthine is yellow, very soluble in water and alcohol, slightly in ether; the solution passes to orange-red by contact with alkalies, to lemon yellow by acids. It is devoid of odour, but has a sweetish bitter taste. The red colouring matter of madder tinges the bones, milk, and urine of animals if fed on the roots. The great consumption of madder is as a dye stuff for giving a red colour to wool, silk and cotton. In pharmacy the roots are sometimes used for colouring ointments.—*O'Shaughnessy, page 378.*

RUBINA. Once the most celebrated tribe in Arabia, is now a small broken clan. The Anazeh Arabs come of this race.—*Rich's Residence in Koordistan, Vol. II, p. 258.* See Khazerij.

RUBRUQUIS, Father William, made a journey in A. D. 1253, to Karakorum, in the reign of Louis IX. of France, and of Mangoo Khan, the grand-son of Junguez Khan, of Tartary. The Khan referred to is called by Rubruquis, Sartach; but in the works of later French missionaries he is called Gayook Khan. He was the son of Batoo, at that time great Khan of the western tribes, and conquered territories of the Mongols beyond the Caspian Sea. Crossing the Euxine to the Crimea, Rubruquis found Sartach in the pastures between the Don and Wolga, which are now occupied by the Cossacks. By Sartach he was sent on to Batoo, who was then near the Wolga: from the report of Father Rubruquis, Nestorian Christians abounded at the courts and in the territories, as well of Batoo Khan as of his superior Mangoo Khan; that they had great influence with many at court, especially of the wives and daughters of these and other chiefs; Rubruquis relates that the reply of Mangoo Khan to the letter of king Louis, was written in the Mongolian language, but in the character of the Jugures or Chakars, which had been introduced by Nestorian Christians, and was derived from the Syrian, but written in lines down the page, commencing from the left. Mongolian is so written at the present day.—*Prinsep's Tibet, Tartary & Mongolia, p. 1 to 17.*

RUBUS, a genus of plants of the Order Rosaceæ, of which the following East Indian species are the better known, viz. 1.—

R. as per, Nepal.
R. biflorus, Sm. Punjab.
R. ellipticus, Sm. Nepal.
R. distans, Nepal.
R. gowreephul, Roxb., Neilgherries and other mountains of India.
R. gracilis, Roxb. Nepal.
R. hexagynus, Roxb. Peninsula.
R. micranthus, Nepal.
R. moluccanus L. Tavoy, Moluccas, Khasia.
R. lasiocarpus, Sm. Neilgherries.
R. paniculatus, Sm. Nepal.
R. pauciflorus, Wall. Nepal.
R. parviflorus, L. China, Nepal.
R. rugosus, Sm. Peninsula.
R. Wallichianus, W. and A. Peninsula.

Griffith says there is a species of rubus in the Tenasserim Provinces, and Wallich found one on the Irrawaddy; but whether either produces an edible fruit or not, Mr. Mason was unable to say.—*Voigt. Roxb. Mason.*

Rubus fruticosus like *R. idæus*, grows at Cashmere, and in the N. W. Punjab from the plains up to 5,000 feet, has dark purple fruit, used to make a preserve on the hills.—*Thirty-five years in the East by Dr. Honig. p. 337. Dr. J. L. Stewart. Mr. Powell.*

RUBUS GOWREEPHUL. Roxb.

R. indicus, Rottler.
 Wild raspberry... ..ENG. | Gowreephul... ..HIND.

A plant with small white flowers, grows in Ceylon, the Neilgherries, Kumaga, Khasiya, Assam, Taong Dong, common amongst the woods betwixt Hurdwar and Sirinagar; also grows plentifully in Mysore and Wynaad.
-Ainslie, page 225.

RUBUS LASIOCARPUS. Sm.

<i>R. albescens</i> , Roxb.	<i>R. Mysorensis</i> , Heyne.
<i>R. racemosus</i> , Roxb.	Gowriphul... ..DUK.
Blackberry... ..ENG.	Pukuna... ..HIND.
Country raspberry. ,,	Pakania... ..KAGHAN.

A plant of Dehra Dhoon, Kaghan, Neilgherries, Dindigul, Mysore and the Bombay presidency, now cultivated generally in the Deccan, and believed to have been first brought from the Mysore Hills. It grows easily from seed; a few of the ripe fruit rubbed on a sheet of paper, and dried in the sun, will enable one to forward the seed to friends at any distance. The same with the strawberry. The plants should never be nearer than four or five feet, and may be cut down at the commencement of the rains, when they will throw out fresh shoots, bear fruit in abundance. As it requires little care, and only an occasional supply of water, this bramble forms a very perfect and secure hedge to a kitchen garden. The finest fruit is very inferior to a common raspberry.—*Drs. Riddell. Voigt. Cleghorn.*

RUBUS INDICUS. Rottler, syn. of *R. gowreephul*.—Roxb.

RUBUS MICRANTHUS, a native of Nepal.

RUBUS PURPUREUS. Himalayan raspberry. Akhi of Kulu.—*Cleghorn's Punjab Report, Kullu and Kangra, p. 81.*

RUBUS RUGOSUS is described by Graham as found in Mahableshwar. *Riddell.*

RUBUS TILIACEUS. Sm.

Pulla... ..KANGRA.

A black fruited species not uncommon from 4,500 to 8,500 feet, up to the Indus. The fruit is black and not much prized.—*Dr. J. L. Stewart, M. D.*

RUBY.

Yakut....AR...	HIND.	Merah; Manekam MALAY

Rubin... ..	GER.	Kembu kalloo... ..TAM.
Lal... ..	HIND.	Kempan Rai... ..TEL.
Rubino... ..	IT.	Yakut... ..TURK.

Ruby and sapphire though differing so greatly in appearance, are chemically the same substance, pure alumina. The ruby of Pliny includes the ruby, the pyrope, the almandine and red jacinth. The ruby is not affected by the fire, acausti, but the garnet fuses into a dark globule of oxide of iron. The spinel ruby is a perfect octohedron, but the common garnet is a rhombic dodecahedron. The best come from India, Burmah and Ceylon, Bohemia furnishes an inferior article, they are found in Ava, Siam, the Cupelam mountains, ten days journey from Syrian, a city in Pegu, Ceylon, India, Borneo, Sumatra, on the Elbe, on the Espailly in Auvergne and Iser in Bo-

hemia. Ruby or red sapphire is the most valuable of all gems when of large size, good colour and free from flaws. The ruby, in colour varies from the highest rose tint to the deepest carmine, but the most valuable tint is that of "pigeon's blood" a pure deep rich red. The spinel ruby and Balas ruby belong to the spinel class of minerals as also are several of the gems sold as Ceylon rubies. Tourmaline, when of a red colour is called Brazilian ruby, and this term is also applied to the artificially coloured topaz star rubies are asteriated corundums. The ruby brings a higher price than the diamond, ranges as under ;

Carat... ..	1	1½	2	3	4
£	14	25	70	200	400
	20	35	80	250	450

Tourmaline is sometimes mistaken for the ruby, and the pink topaz for the Balas ruby. Spinel and Balas rubies are found in Ceylon, Ava, Mysore, Beluchistan—the spinel ruby is comparatively of little value, but they are often sold for a true ruby and the true ruby is occasionally parted with as a spinel ruby. The best have the redness of the alchermes dye : the Balas ruby is of a more diluted colour or of a lilac : the spinel is of the richest crimson tinged with blue. Both the spinel and the balas ruby possess the property of becoming electric in a very high degree, to the same extent as the sapphire and the Brazilian topaz : the almandine garnet is non-electric. The Oriental ruby is surpassed in hardness only by the diamond and sapphire. Green ruby is a rare variety of the precious corundum and ought properly to be called an emerald. Ruby is less hard than the sapphire : spinel is even softer. In Ceylon, the ruby, amethyst, topaz, sapphire and cinnamon-stone are found in great abundances, but not emeralds : sapphire, spinel, chrysoberyl and corundum are also found in Ceylon. The sapphires which are red, purple, yellow, blue, white and starstone, are met with at Matura and Saffragam, and rubies and sapphires at Badulla and Saffragam. The corundum is very plentiful at Battagamana, on the banks of the river Agiri Kandura. The great bulk of the gems, however, come from Ratnapura, which means the city of gems, the river near which is regularly worked. Ceylon affords all the varieties of quartz ; as rock-crystal, amethyst, rose-quartz, cats'-eye, and prase : rock-crystal occurs in abundance, both massive and crystallized, of various colors, good quality and in large masses. Amethyst also is pretty abundant. *Ceylon Ruby*, is a term applied in Eng-

land, to the garnets and carbuncles which come from Siam through Ceylon and also to peculiar tinted almandines. The stones are of a rich red tinged with yellow. They are superior to those of the mine of Zobletz in Silesia from the Tyrol and from Hungary. Under the designation "Ceylon rubies" jewellers obtain a large price for them from the ignorant. A stone of a fine rich tint, free from flaws, of a certain size, will range from £3 to £10. Gems are found in the flat country around Ballanagodde S. E., of Ratnapoora, on the western plains between Adam's peak and the sea ;—at Neucruellia, in Oovah, at Kandy, at Matelle in the Central Province, and at Ruanelle near Columbo, at Matua, and in the beds of the rivers eastward towards the ancient Mahagam. But the chief gem district is in the plains at the foot of the stupendous hills of Saffragam. Next in rank to diamonds according to the ideas of the native jewellers of India, come rubies. They must be hard and transparent, "shafaf." The most esteemed kind is the yakut rumani, "whose color is like the seed of a pomegranate." There are inferior kinds of rubies, classed as "lalri," and garnets' tambra, &c. They enumerate among rubies the "dudi" or tansala, which is a kind of "smoky" cairngorm, and the "naringi," which is supposed to be the jacinth also called gulmidak, and which English jewellers sometimes erroneously call "cinnamon ruby." The kinds distinguished by the appellation, "zafrani," and "zard," or phokraj, are pale and dark topazes. Included as a sort of rubies, also, come sapphires, called by the epithets, "kabud," "asmani," "surmai" color of antimony, blue grey. A native jeweller informed Mr. Powell that they came from "Jazirah Pigu," by which he meant Burmah. The blue rubies are sapphires and are brought from Ceylon.

Balas Ruby is a term used by lapidaries to designate the rose-red varieties of spinel. It should be carefully distinguished from the oriental ruby, the sapphire, a gem of much greater variety and value.

Badakshan had been famed since the time of Marco Polo as the country producing the true Balas ruby, but is not now known to produce any : it still produces the *Lapis lazuli*. A ruby worn on the finger is supposed to protect the wearer from nightmares in his sleep and from evil dreams.

Rubies of Badakshan are found in limestone. Spinel, sapphire, corundum and chrysoberyl occur in Ceylon, in gneiss or granitic rock : spinel is comparatively rare. Dr. Davy got small and very beautiful crystals of it, which were said to have been brought from the interior, and he found

it in specimens of clay iron-ore, from a part of the Kandyan country where gneiss is the prevailing rock. Sapphire is much more common, it occurs in considerable abundance in the granitic alluvion of Matura and Saffragam, and in the neighbourhood of Avisavelli, and on the Neuraclyiapatam. The corundum of Battagammana is frequently found in large six-sided prisms, is commonly of a brown colour, whence it is called by the natives "Curundu galle" cinnamon stone; occasionally it is to be met with partially or entirely covered with a black crust, which is merely the stone with an unusual proportion of iron. In the beds of the rivers south and east of the mountain chain in Ceylon, the sands are so rich in comminuted fragments of mica, quartz, sapphire, ruby and jacinth, as in some places to be used by lapidaries in polishing the softer stones and sawing elephant's grinders into plates. Dr. Gygax considered the original matrix of these rubies to be a stratum of decomposed grey granite at Ylima Pohura on the south-eastern decline of the Pettigalle Kanda. Rubies have, from time to time, been discovered in many of the corundum localities of Southern India, associated with this gem, particularly in the gneiss at Viralimodos and Sholasigamany. It occurs also in the Trichingode talook and at Mallapollaye, but it is, comparatively speaking, rare.

The ruby mines of Burmah are separated from the valley of the Irawadi, by a noble range of mountains, which are only occasionally visible from the town of Male, owing to the constant fogs and mists that hang around, and snow lies on them for four months of the year, beginning with the middle or end of November. They are situated north-east from Mandalay and distant about sixty or seventy miles. The principal road to them leaves the Irawadi at Tsinguh-Myo, and passes through Shuemale. There are other roads, from Tsampaynago and other villages to the north. The mines lie nearly due east from the village, being separated from the valley of the Irawadi by the lofty range of the Shuëdoug mountains. The villages in the immediate neighbourhood of the mines are Kyatpen, Mogouk, and Katheyuwa. The precise limits within which the gems are found are unknown, but they are, or have been, procured over an area of probably 100 square miles. The mode of seeking for them is simply sinking pits until the gem-bed or ruby earth is met with, this is then raised to the surface and washed. The gem-bed is met with at various depths, sometimes not more than two or three feet from the surface, and occasionally not at all. When the layer of earthy sand

containing the rubies is met, lateral shafts are driven in on it, and the bed followed up, until it either become necessary to sink another pit in it or it become exhausted. It varies in thickness from a few inches to two or three feet. The rubies are, for the most part, small, not averaging more than a quarter of a rutti, and when large are generally full of flaws. Well marked crystals occasionally occur, but the vast majority of stones are well rounded and ground down. It is very rare to find a large ruby without flaws: and Mr. Spears states that he had never seen a perfect ruby weighing more than half a rupee. The same authority mentions that the sapphires are found in the same earth with the rubies, but are much more rare and are generally found of a larger size. Stones of ten or fifteen rutti without a flaw are common, whereas a perfect ruby of that size is hardly ever seen. The largest perfect sapphire he ever saw weighed one tikal. It was polished, but he has seen a rough one weighing twenty-five tikal. For every five hundred rubies, he does not think they get one sapphire. You see very small sapphires in the market, while small rubies are abundant and cheap. The value of the gems, rubies, and sapphires, obtained in a year may be from $1\frac{1}{2}$ to $1\frac{1}{2}$ lac, from £12,500 to £15,000. They are considered the sole property of the king and strictly monopolized, but, notwithstanding the care that is taken, considerable quantities are smuggled. There are about twenty lapidaries or polishers of these stones at Amarapoora; they are not allowed to carry on their trade at the mines. For polishing, small rubies and worthless pebbles brought from the mines being pounded fine and mixed up with an adhesive substance, and then made into cakes, some ten inches long by four broad, are employed to rub down the gems. After it has been brought to the form and size required, another stone of finer grain is employed. The final process is performed by rubbing the ruby on a plate of copper or brass until it is thoroughly polished, when the gem is ready for the market. Rubies of Burmah are not exported to any large extent, and then only stones of inferior value. But a pink spar found in the ruby district is a more important item of export. It is believed to be used for one of the classes of distinctive mandarin cap-knobs. All attempts of Europeans to visit the Burmah mines have hitherto been frustrated by various impediments thrown in their way by the Burmese authorities, who are very zealous of too close a scrutiny into the source of wealth on which they so much pride themselves. Great numbers of these gems are brought down to Rangoon for sale, but a heavy price is always

demanded for them, and it requires an experienced eye to purchase them with a view to profit. Topazes are also found in the vicinity of the rubies and sapphires, but they are scarce, and fetch a higher price in Burmah than they would realise in England.

Spinel Ruby. Mr. Mason says that by far the larger proportion of the rubies offered for sale, are, it is believed, spinelle rubies. He had a small specimen which every native who had seen it, regarded as one of the best kind of rubies, or red sapphire, but its natural crystalline form is easily recognized, as a regular octahedron; while that of the oriental ruby is a six-sided figure, or some of its modifications. The spinel is seen of all shades blood red, the proper spinelle ruby; rose red, the balas ruby; orange or red rubicelle; and violet colored or almandine ruby. It is not an easy task to distinguish, accurately, the true character of the different stones offered for sale as rubies. Both Europeans and Natives often make great mistakes. An English officer bought a "ruby" in Maulmein a few years ago, for fifteen rupees, his friend bought one for five rupees: and the rubies were thought to be of nearly equal value; but on walking into a jeweller's shop in Calcutta, a year or two afterwards, the jeweller offered four hundred and fifty rupees for the one but refused to give two rupees for the other characterizing it as "a worthless garnet."

Tavernier gives the figures of a ruby that belonged to the king of Persia. It was in shape and bigness like an egg, bored through in the middle, deep coloured, fair and clean, except one flaw in the side. They would not tell what it cost, nor what it weighed; only it had been several years in the treasury. He likewise gives the figure of a Balleis ruby, sold for such to Giafer Khan, uncle of the Great Mogul who paid 9,50,000 rupees = 1,425,000 livres for it. But an old Indian jeweller affirming, afterwards, that it was no Balleis Ruby, that it was not worth above 500 Rupees, and that Giafer Khan was cheated; and his opinion being confirmed by Shah-Jehan, the most skilful in jewels of any person in the empire, Aurengzeb compelled the merchant to take it again, and to restore the money back. Tavernier gives also the figure of a ruby belonging to the king of Visapour. It weighed fourteen mangelin, or seventeen carats and a half; a Visapour mangelin being but five grains. It cost the king 14,200 new pagodas, or 74,550 livres. Also he figures a ruby that a Bania showed him at Benares, it weighed 58 ruttis or 50½ carat; being of the second rank in beauty; in shape like a plump almond bored through

the end. He offered 40,000 rupees, or 6,000 livres for it, but the merchant demanded 55,000 rupees.

The largest oriental ruby known was brought from China to Prince Gargarin, governor of Siberia; it afterwards came into the possession of Prince Menzikoff and now constitutes a jewel in the imperial crown of Russia." *Eng. RUDAK, a district in the N. W. Himalaya. Benedict Goetz, a Portuguese monk, went from Lahore, by Kabool to Kashgar, and across the sandy desert, into China, where he died in A. D. 1607; his route was far north of Tibet. Anthony Andrade, a Jesuit passed through Kumaon to the Manasarawa lake, and thence went on Rudak, on the western confines of Tibet. His journey was made in 1624, and is discredited by commentators and geographers, because of his mentioning this lake as the source of the Ganges and Indus, instead of the Sutlej. There is no doubt, however, that the voyage is genuine, though we have no details of it.—*Prinsep's Tibet, Tartary and Mongolia*, p. 12. See Rudok.

RUDAKI, about the close of the 9th century, translated the fables of Bed-Pai from Arabic

into Persian and received 80,000 dirhams for his labours.

RUDBECKIA FULGIDA, a showy plant, grows in any common soil, attains a large size, and is adapted for a shrubbery; the colours of the species are chiefly yellow, and orange propagated by seed or by dividing the roots.—*Riddell*.

RUDHI also Vriddhi. **TEL.** The two different names of the ashta varga or eight roots celebrated in the Indian *Materia Medica*. They are only from Nepal or Northern India and have never been identified.—*As. Res. xiii. 410, 4to. edition.*—See Kakoli.

RUDOK, a district in the neighbourhood of Lake Tso Mognalari L. 38 N. and L. 80 E. See India; Ladak; Pangkong Lake; Rudak.

RUDRA, in the Rig-Veda, is spoken of as an inferior god; one of a kind of semi-divine beings (eight in number,) now usually regarded as manifestations of Siva, but in the earlier ages of hindu mythology connected with the worship of Vayu or the wind. The eight Rudra are thus enumerated in the Vishnu Purana,—Rudra, Bhava, Sarva, Isana, Pasupati, Bhima, Ugra, Mahadeva, most of which are merely other appellations for Siva. Brahma, assigned to them as their respective stations the sun, water, earth, air, fire, ether, the ministering brahman, and the moon. These are their types or representatives in this world. In other places the Rudra are described as eleven in number, and as children of Kasyapa and Surabhi.—*William's Story of Nala, p. 40. Vishnu Purana, p. 58.* See Hindoo; Siva Indra; Inscription.

RUDRA SAH. See Inscriptions; Junagurh.

RUDRA SAMPRADAYI, or Vallabha-Chari, a sect of vaishnava hindus, founded by Vallabha Acharya, who originated the worship of Bala Gopala, the infant Krishna. This worship is very widely diffused amongst all ranks of India society, but is perhaps best known as the religion of the Gokulast'ha Gosains, the title of its teachers. Vallabha was son of a Telinga brahman. He taught that privation was not sanctity, and that it was the duty of the teachers and his disciples to worship their deity, not in nudity and hunger, but in costly apparel and choice food; not in solitude and mortification, but in the pleasures of society and the enjoyment of the world. The gosains or teachers, like Vallabha, are always married men, always clothed with the best raiment and fed with the daintiest viands by their followers over whom they have unlimited influence. The followers of the order are especially numerous amongst the mercantile community, and gosains are constantly travelling over India under the pretence of pilgrimage, but reconcile to themselves on these occasions, the profits of trade with the benefits of devotion. Zealous disciples devote to the guru the threefold Samarpana, *Tan, Man, Dhan*, or body, mind, and wealth. The temples and houses of the sect have metal, often gold, images, of Gopal, of Krishna and Radha, and other divine forms connected with the incarnation. The idol is richly decorated and sedulously attended in daily ceremonials. Besides their public demonstrations of respect, this sect keep pictures and images of Gopal in their houses; and before sitting down to any of their meals, they take care to offer a portion to the idol. Those of the disciples who have performed the triple Samarpana, eat only from the hands of each other, and the wife or child that has not exhibited the same mark of devotion, can neither cook for such a disciple nor eat in his society. Vittala Nat'h was the son and successor of Vallabha, Vittala had seven sons, all of whom were teachers, and their followers, though in all essential points the same, form

separate communities. Those of Gokulnath, however, look on their own Gosains as the only legitimate teachers of the faith. The worshippers of this sect are very numerous and opulent, the merchants and bankers, especially those from Guzerat and Malwa, belonging to it. Their temples and establishments are numerous all over India, but particularly at Mathura and many hundreds at Bindrabun. But at Sri Nat'h Dwar, at Ajmir, is the most celebrated, most highly venerated, and most richly endowed of all the Gosain establishments. It is a matter of obligation with members of this sect to visit Sri Nat'h Dwar at least once in their lives, and the head Gosain presents them with a certificate to that effect. The indecent and immoral character of this sect was notoriously brought before the public of India, in the trial for libel instituted in 1862, at Bombay, by one of the teachers of the sect, and known as the "Maharajah case." It was shown by the evidence then adduced that the women of the wealthiest of this sect deemed it an honour to receive their priest's attentions for which the priest withdrew with the woman of his selection, selected in the midst of, and from amidst hundreds of her fellow worshippers and it was also in evidence that the *Maharajah* allowed people to see him associating with his selection. In 1868, in Bombay, during the holi, indecent pantomimes were shown by this sect before a concourse of men and women. It is the Bania and Bhattya races who chiefly support this sect. — *Wilson. Times of India*. See Hindoo; Vallabha Acharya.

Saturi.....	HIND.	Arooda.....		TAM.

In India, this name is given to the herbs of *Ruta angustifolia* of *R. graveolens* and of *R. indica*. *R. graveolens* is an evergreen shrub, grows freely in any good soil, propagated by cuttings in damp weather, used for fowls in the roup. Leaves dried and burnt are much used in Southern India for the purpose of fumigating young children suffering from catarrh, also used fresh bruised and mixed with arrack as an external remedy in the first stages of paralytic affections. When dried in the shade and powdered the vytiens prescribe this substance in conjunction with certain aromatics in cases of dyspepsia, they likewise entertain the same notion regarding it that Dioscorides did of old, viz. that it is inimical to the fœtus in utero when given together with camphor and the sugar of the

palmyra toddy. In making confection of rue, the herb of dried rue, the sudab of the bazars of N. W. India, may be substituted. — *Jaffrey. Ains. Materia Med. p. 38. Beng. Phar. p. 273.*

RUELLIA, a genus of plants, of the natural order Acanthaceæ, of which several species occur in the south and east of Asia. Roxburgh and Wight name the following species, but several have been transferred to other genera ;

balsamica.	imbricata.	racemosa.
bracteata.	infundibulifera.	ringens.
cernua.	mis,	salicifolia.
comosa.	latebrosa.	sarmentosa.
dependens.	longifolia.	suffruticosa.
pasciculata.	maculata.	triflora.
flagelliformis.	obovata.	uliginosa,
flava.	patula.	and
hirsuta.	pavala.	zoylanica.
hirta.	punctata.	

From one wild species, called in Assam, room, a very valuable dye is prepared after the manner of indigo. This plant (or a species very nearly allied to it) is also cultivated with the same object in Pegu and other parts of the Burmese empire, under the name of Mai-gyee. It is believed that the room contains indigo allied to that produced by species of *Isatis* and *Wrightia*. The source of this dye has been referred to *Ruellia comosa*. That produced at the hills occupied by the Miri and Dullah tribes, of North Assam, and produced at the hills occupied by the Mishmee and Abor tribes, Suddayah, Luchimpore, Upper Assam, is of value 1½d. per lb. The room is employed in its raw state by the Khampthi and Singpho to dye their clothes of a deep blue. It is described by the late Dr. Griffiths as a valuable dye and highly worthy of attention. It might perhaps be usefully employed as the ground for black dye.

RUELLIA CERNUA, *Roxb.* grows in Mysore. *R. Comosa*, *Roxb.* is a plant of the Moluccas. *R. hirta*, *Vahl* grows in Telingana. *R. indigofera*, *Griff* is the My-gye, of the Burmese. — *Voigt. Roxburgh. Wall. Hooker.*

RUELLIA INDIGOFERA. The Burmese cultivate a low *Ruellia* plant as a substitute for indigo which is the "room" of Assam, from which country it has probably been introduced. It forms a blue dye not inferior to that produced by the true indigo plant. — *Mason.*

RUELLIA INDIGOTICA, in one part of the Chekiang province, of China, and also amongst the Fung hwa mountains to the westward of Ningpo, there are large quantities of a blue dye produced, which is in fact the

indigo of that part of the country. Fortune, in his 'Wanderings in China,' published in 1846, gives an account of a valuable kind of indigo, made from a species of woad (*Isatis indigotica*) which is cultivated extensively in the level country a few miles to the westward of Shanghai. The kind in Chekiang is equally valuable, if not more so. It is made from a species of *Ruellia*, which until it gets a better name, may be called *Ruellia indigotica*, the same plant, apparently, has been discovered in the Assam country in India, where it is also cultivated for the blue dye it affords; alongside of the Chinese kind, they bear a most striking resemblance. This *Ruellia* seems to be easily cultivated, it grows most luxuriantly, and is no doubt very productive. Having evidently been found indigenous a little further to the south, in a warmer latitude, it is not hardy in the province of Chekiang any more than cotton is about Shanghai; but, nevertheless, it succeeds admirably as a summer crop. It is planted, in the highland valleys, in the end of April or beginning of May, after the spring frosts are over, and is cleared from the ground in October before those of autumn make their appearance. During this period it attains a height of a foot or a foot and a half, becomes very bushy and is densely covered with large green leaves. The Chinese method of preserving plants for next year's crop is most ingenious and well worth notice. Being somewhat tender, the roots which are left in the ground after the gathering season are all destroyed by the first frosts of winter, and to the formation and preservation of cuttings the Chinese cultivator directs his attention. When the stems are cut down for the manufacture of indigo, a sufficient quantity have their leaves stripped off, and are afterwards taken into a house or shed to be properly prepared. The leaves thus stripped from the cuttings are thrown into the tanks with the other stems and leaves so that nothing is lost except what is actually required for the purposes of propagation. The stems are now tied up firmly in large bundles, each containing upwards of 100, and the ends of each bundle are cut across, so as to leave them perfectly neat and even both at top and bottom. These bundles are each about a foot long, and, of course, nearly round. Having been thus prepared they are carried to a dry shed or outhouse, where, in some snug corner, they are packed closely and firmly together, and banked round with very dry loam. A portion of the dry soil is also shaken in between the bundles, and this being done the operation is complete. Should the winter prove unusually severe, a little dry straw or litter is

thrown over the surface of the cuttings, but nothing else is required. During the winter months, the cuttings remain green and plump; and although no leaves are produced, a few roots are generally found formed, or in the act of forming, when the winter has passed and the season for planting has come round. In this state they are taken to the fields and planted. The weather during the planting season is generally showery, as this happens about the change of the monsoon, when the air is charged with moisture. A few days of this warm showery weather is sufficient to establish the new crop, which now goes on growing with luxuriance, and requires little attention during the summer; indeed none, except keeping the land free from weeds. In the district where this dye plant is grown, there are numerous pits or tanks on the edges of the fields. These are usually circular in form; one measured eleven feet in diameter, and two feet in depth. About 400 catties of stems and leaves are thrown into a tank of this size, which is then filled to the brim with clear water. In five days the plants are partially decomposed, and the water has become lightish-green in colour. At this period the whole of the stems and leaves are removed from the tank with a flat-headed broom made of bamboo twigs, and an admirable instrument for the purpose. When every particle has been removed, the workmen employed give the water a circular and rapid motion with the brooms just noticed, which is continued for some time. During this part of the operation another man has employed himself in mixing about thirty catties of lime with water, which has been taken out of the tank for the purpose. This is now thrown into the tank and the rapid circular motion of the water is kept up for a few minutes longer. When the lime and water have been well mixed in this way the circular motion is allowed to cease. Four men now station themselves round the tank and commence beating the water with bamboo rakes made for this purpose. The beating process is a very gentle one; as it goes on the water gradually changes from a greenish hue to a dingy yellow, while the froth becomes of a beautiful bright blue. During the process the head workman takes a paleful of the liquid out of the tank and beats rapidly with his hand. Under this operation it changes colour at once, and its value is judged of by the hue it presents. The beating process generally lasts for about half an hour. At the end of this time the whole of the surface of the tank is covered with a thick coating of froth of the most brilliant colours, in which blue predominates, particularly near the edges. At

this stage, it being desirable to incorporate the froth with the liquid below it, there is made a most beautiful chemical operation and shows how universally must be the knowledge of the effect of throwing "oil upon the waters." A very small portion of cabbage oil—only a few drops, is thrown on the surface of the froth, the workmen then stir and beat it gently with their flat brooms for a second or two, and the whole disappears as if by some enchanter's wand. And so small a quantity of oil was necessary for this purpose that even when the cup has been emptied, and has only the oil that is necessarily adhering to its edges, it was thrown into another tank, and produced the desired effect. The liquid, which is now darker in colour is allowed to stand quiet for some hours, until the coloring matter has sunk to the lower stratum, when about two-thirds of the surface is drawn off and thrown away. The remaining third part is then drawn into a small square tank on a lower level, which is thatched over with straw and here it remains for three or four days. By this time the colouring matter has separated itself from the water, which is now entirely drained off—the dye occupying three or four inches of the bottom in the form of a thick paste, and of a beautiful blue colour. In this state it is packed in baskets, and exposed for sale in all the country towns in this part of China. What its intrinsic value may be when compared with the indigo of commerce, there are no means of ascertaining but it is largely used in China, where blue is the most fashionable colour, judging from the dresses of the people, and it is possible that with European knowledge of chemistry a colour of this kind might be greatly improved. After being grown and manufactured, it is sold at rates varying from 50 to 100 cash a catty, say from 2*l.* to 4*d.* per lb. Some is sold as low as 30 cash, but this is very inferior, the greater part produced is sold at from 60 to 80 cash a catty, and it must be of a very superior quality if 100 cash is paid. Like the Shanghae indigo made from *Isatis indigotica*, it is called "Tien-ching" by the Chinese. During the season of its preparation every mountain stream is colored and polluted with the refuse liquid drawn off from the tanks and the stench which fills the air is almost unendurable.—*Fortune's Residence among the Chinese*, page 189. *Fortune's three years Wanderings in China Fortune's Residence.*

RUMEX ACETOSA.

Sorrel..... ENG. | Kautli..... HIND.
Chuka..... HIND.

It is cultivated in Ajmeer, the seed is considered cooling and astringent. It is found in the Sutlej valley between Rampur and Sungnam at an elevation of 6,000 to 8,000 feet also in Kaghan. It is widely distributed.—*Cleghorn's Punjab Report*, p. 67. *Gen. Med. Top.* p. 130.

RUMEX ALPINUS, or Monk's rhubarb, is found on the European Alps, the Crimea, and Mount Caucasus. The roots are large and purgative like rhubarb, and the whole plant so resembles the Rheum that Linnæus himself mistook one for the other.—*O'Shaughnessy*, p. 522.

RUMEX OBTUSIFOLIUS vegetates in Cashmere, and is eaten by the natives. Its root, under the name of Radix Spathiaceuti, was formerly used as a purifier of the blood in chronic cutaneous diseases, but is now obsolete, both in India and in Europe its active principle, Lapatin, must, however, have peculiar properties. From the decoctions of the dried roots of various sorts of sorrel, by the addition of alum, can be obtained a fine red color, at a low price, and valuable to painters. *Rumex undulatus*, *Royle*, is Himaz or Pulkee.—*Thirty-five years in the East*, by Dr. Houg. p. 338.

RUMEX VESICARIUS. *Linn. Roxb.*

Chok ; Chuk ; paleng HIND.	Chukka kura... TEL.

Cultivated for greens, &c., grows plentifully about Madras in the fields during the rains ; it has obtained the name of sorrel from the British in India, owing to its great resemblance to the *Rumex acetosa* in taste and other natural qualities. It is an article of diet and is considered by the Natives as cooling and aperient. This, where water is abundant may be had for eight months in the year ; it is sown in drills or on the edges around other beds ; the leaves are sold in bundles from one to two pice a seer. There is also another species called the Indian Red Sorrel.—*Riddell. Ains. Mat. Med.* p. 257.

RUMI-KHAN. The Portuguese early endeavoured to obtain possession of Diu. Their

first effect was defeated by Rumi Khan, commander of the Guzerat army. In 1536, however, Bahadur Shah of Guzerat permitted them to erect a fortress there. It was completed in 1538, from which time the Portuguese became the terror of the sea, and were able to resist the efforts made to subdue them by the emperor of Turkey, the kings of Bejapore and Ahmednuggur and the zamorin of Calicut.

RUMI MUSTAKI. HIND. TAM. Mastic.

RUMINANTIA, the ruminants or ruminating animals, such as camels, deer, horned cattle and sheep. The ruminants are a tribe of mammals of the order Ungulata, which may be thus shown,

Var. b. Spirocercus, Hodgs.

Mr. B. Hodgson notes on some of the Ruminantia as under ;

Cervids.—Mrigadi ; Haranadi. The Sanscrit postfix adi, meaning et cetera, is the probable etymon, and certain equivalent of the Latin idæ and iæ. Hoofs cloven. Postal plane of skull forming an obtuse angle with frontal. Horns solid, falling annually, proper to males only, (save Rein Deer) inserted, superiorly and proximally, below the frontal crest. Front teeth in the lower jaw 8. None above ; canines normal and constant, found in both sexes, or in the males only. Molars $\frac{2}{3}$. Muffle normal and constant (save only in Rein Deer and Elk). Teats 4, normally and constantly, Eye-pits constant. Groin pits vaguely defined or wanting. Feet-pits usually present, in all 4 feet or only in the hind.

Cervus ; Stags.—Mriga ; Haran. Horns in males only much branched, 2 basal, one central, and several terminal snags. Muffle large covering the front of upper lip. Eye-pits moderate and moderately mobile S shaped. Feet-pits large in all 4 feet. Groin-pits none. Calcic gland tuft posterior and external. Teats four. Canines in males only. Types, *Cervus elaphus* of Europe *Cervus affinis* of Saul forest or Mul Barah Sinha and Geana or *Cervus wallichii* of Tibet. These animals are further characterised by a very short tail; a large disc or pale space round the tail, and no proper mane. The Indian ones are confined to vast primitive forests on the plain.

Rucervus.—Baraiya or Barah Sinha. Horns in males only, with one basal snag and no central one, but their summits many branched as in the true Stags or Elaphus. Muffle large, covering front of upper lip. Eye-pits moderate, mobile moderately. Feet-pits ? Groin-pits none. Calcic gland and tuft ? Teats four. Canines in males only. Type *Cervus elaphoides vel duvaucelli*. This is the Baraiya or Barah Sinha. It inhabits reedy marshes and islands of great rivers along the whole Eastern and Northern skirt of Bengal and Hindostan. Never enters the mountains or forests. Herds enormous in the Islands of Brahmaputra. These animals are further distinguished like the true stags, by the absence of the heavy mane of the Rusa, and by a short tail which however has no true caudal disc and is longer than in the stags proper ?

Procervus. Gour or Gower and Ghos.—

Horns in males only, small, smooth, greatly divergent, and much bent in the beam, like Bos and furnished with only one ? snag which is basal and forward, another subterminal ? Eye-pits medial, vertical. Feet pits none. Groin pits none. No calcic tuft nor gland ? Teats four.

Tushes in males only. Type *Cervus di-*

morphe. The Gour, or Ghos. Habitat Saul forest. Further subordinate marks of this genus are :—Tail short. No caudal disc. A mane. The Gower are not gregarious. They are confined to the Saul forest so far as appears. With their rutting season and gestation, unacquainted. Intestines 56 feet, small 29, great, 27, Cæcum, 19 inches by 4, diameter of small gut $\frac{3}{4}$ inch. Liver 3-lobed and a lobulus. Lungs 4-lobed Gall-bladder.

Rusa.—Samber, Jarai, (vulgo Jerrow.) Horns in males only, trifurcate : 1 basal and 1 sub-terminal snag. No central one. Muffle large, covering the front of upper lip. Eye-pits very large and completely reversile. Feet-pits large in all 4 feet. Groin-pits none. Calcic gland and tuft, posterior and external. Teats four. Canines in both sexes.

Type, Hippelaphus or the Sambur, and Aristotelis or the Jarai : both continental species of India. Also, in the Islands, *Equinus Peronii*, Etam, and *Marriannus* : but they want testing all of them. Habitat, all the great forests of India and of its islands, and to a certain extent, the mountains above them, where the other large Deer are never seen. These animals are not gregarious : they have a long bluff tail like that of a docked horse, no disc round it ; but a heavy mane over the whole neck. One anomalous species, thence called *Heterocerus*, has no upper snag to its horns. Another large deer of the Indo Chinese ranges of Hills is *Panolia Fedii*, the *Cervus frontalis* of Mr. McClelland. Not found West of the Brahmaputra. The Rusa rut in spring and then drop their horns. Their females gestate 8 months and produce young in winter, occasionally so early as the end of October, and one at a birth. In confinement the horns are usually dropt in April and take six months for their perfect replacement. The horns are not complete in form till the 4th year nor in size till the 8th year. Small gut 52 feet. Large 31. Cæcum 15 inches by 4 $\frac{1}{2}$.

Axis. Chittal, Chittra, chitiri. Horns in males only, with one basal and one subterminal snag as in Rusa, but the beam more bent and the horns paler and smoother, and closer grained in structure.

Muffle large, covering front of upper lip. Eye-pits large, very mobile. Feet-pits large, in hind feet only. Groin gland large ; sinus vague. Calcic gland and tuft, postæal and external. Teats four. Canines in both sexes. Types, 1, *Axis major vel maculata vel nudipalpebra*, or common spotted Deer or Chittal ; 2 *Axis medius* or lesser spotted Deer or Jhow Laghuna ; 3, *Axis porcinus vel niger*, or Hog Deer, or Para or Khae Laghuna, or

Sugoria. Habitat, general over the plains of India whence the progress of cultivation has long since driven the larger Deer or Barah Sinha and Rusas and Gower recte Gour. These animals have a smooth, generally spotted, coat, no mane, and a long tail reaching to the back and ending in a point. It is singular that H. Smith should question their having eye-pits and canine teeth. The spotted deer are gregarious, the herds being often very large: the Hog Deer are less so, dwelling more in families. Their breeding season is May, June: their rutting season December, January. They gestate 6 months. Intestines of lesser spotted species 65½ feet, whereof the small are 40 and the great 25½. Cæcum 9½ inches by 3½ and 5 inches of gut below it, of same calibre; rest equal and narrow. Intestines of Hog Deer 41½ feet whereof the lesser are 24½ and the larger 16½, Cæcum 8½ inches by 2½. They rut and breed like the spotted species.

Styllocerus, or Stilthorn or Muntjac. Daria-Mriga; Ratwa, Kaker.—Horns in males only, small, raised on high hairy pedicles, and having only one snag which is basal. Females with bristly tufts ending in knobs instead of horns. Eye-pits very large and extremely mobile. Facial creases, large, mobile, glandular, placed along inner side of horn pedicles towards their very forward salient bases. Feet-pits large, in hind feet only. No groin-pits. Mammaræ four. Canines in males only? large trenchant, and exerted, as in the musks. No calcic gland nor tuft. Sty. vaginalis or the Kijang of Indian Islands. Sty. Ratwa or the Kaker of Indian Continent. Habitat, general in India mountains and in forests at their bases. Never elsewhere. Seldom seen above 7,000 feet in the Sub-Himalaya. The Muntjac are not gregarious though 6 or 8 are occasionally found together. They prefer the dells to the tops and the close to the open cover. Copse or brushwood of the Chinese bambu is a favorite retreat. They bark all the year but particularly in winter when the males are wanton. January, February is the common rutting, and June, July the common breeding season: the gestation being 6 months, but they breed occasionally at any season though only once a year, and have one or two young at a birth. The males' horns fall in May and are perfect again in August. Intestines male 61 feet, whereof the small are 44 and large 17 feet. Cæcum 15 inches by 2½ inch and 9 inches of gut below it of same size. Rest, ¼ to 6½ inch wide. Intestines female, 14 feet, whereof small 34 feet and

great 15. Cæcum 12 inches by two, 12 inches of gut below it of like diameter.

Moschida: the musks.—Kasturadi; Mushkadi. Feet cloven: no horns; front teeth and below, none above. Molar teeth $\frac{3}{4}$ Canines large: cranium cervine with the two planes gradually blended.

Moschus, kastura; Mushk Hirn. Mufle large, as in deer. No eye-pits. No feet-pits. Large caudal gland with lateral pores. No inguinal pits. Calcic tuft and gland external postea. Large preputial gland and sac secreting the substance called musk, proper to males only. Teats four. False hoofs very large, acute, and touching the ground. Canines in both sexes: of males, large and exerted; of females, small. Types, 1, Moschiferus; 2, Chrysogaster; 3, Lucogaster. Inhabit the great snowy mountain barriers of high Asia from the Himalaya to the Altai, and from Beluttag to the Peling and Gajar. The Musks are confined to the snowy region and glassy precipices which they leap with a power and security far more than Caprine, though owing to the unequal length of their legs they can descend slopes only with difficulty and falling are caught. They cannot climb at all, as goats do, and are solitary. They rut in winter and produce young in summer (May, June) gestating 160 days. In 6 weeks the young can shift for themselves and the mother drives them off. They can procreate ere they are a year old and live 10 to 15 years. One usually is produced at a birth in the cavities of the rocks. Intestines 33 to 36 feet, whereof the small are 23 to 24 and the great 10 to 12 feet. Cæcum simple 8 to 9 inches by 1; mean diameter of gut 1 inch. Gall bladder constant; Prof. Owen doubts this, but Hodgson tested it a dozen of times since Dr. Campbell and he made the first examination in Nepal.

Meminna: Pizora, Pise Pisai.

Mufle large. No eye-pits. No feet-pits. No groin-pits. Calcic gland nude and external. No preputial bag. Four teats. False hoofs, ordinary, small. Canines not exerted, and confined to males. Type, Meminna Indica Pizora and Pisai. Inhabits the forests of India in all parts, near to, but without, the various ranges of Hills.

Ovicornia minores.—Lesser hollow horned Ruminants or Flocks. Hoofs cloven. Occipital plane of skull forming a small or large angle with frontal plane. Horns hollow, sheathed persistent, with thin and dense or thick and porous cores. Mufle small, for the most part, or wanting. Front teeth 8 below. None above. Canines present or absent. Molars $\frac{3}{4}$ or $\frac{5}{8}$. Teats 4 or 2. Eye, feet, and groin, pits, present or absent.

Antelopidae.—Antelope kind, Sasinadi; Occipital plane of skull forming an obtuse angle with the frontal plane. Core of the horns thin, consisting of dense bone often with a clear sinus at the base within. Horns seated on the superior surface, below the crest of the frontals, and apart at bases. Canines frequent. Mufles present or absent. Teats normally 4 or 2. Feet-pits in all 4 feet or only in the hind ones. Eye-pits present or absent. Groin-pits present or absent. These animals have also occasionally maxillary, intermaxillary and post orbital sinuses, the number and high development of these organs being one decided characteristic of the family.

Tetracerus.—Chousinha, Chouka. Horns in males only four in number. Two inter-orbital; and two behind eyes, but below crest of forehead. Mufles large, as in deer. Eye-pits medial, linear, longitudinal. Feet-pits in hind limbs only or none. No inguinal pits. No calcic tuft or gland. Teats four? two? Canines in the males. Types 1, Chekara; 2, Quadricornis; 3, Subquadricornutus; 4, Jodes; 5, Paceroois. (See Calcutta Journal Natural History for May, 1847.) Inhabit the forests of India generally. Avoid mountains and open plains. Not; gregarious. Rutting season, Summer. Breeding season, winter. Gestate 6 months, most young born in January, February. They are very shy, and when hunted is close or go off far ahead bounding like a common antelope, and hence one of their names, from chouk, a leap.

Antelope.—Antelopes Proper; Sasin. Horns in males only. No mufles. Eye-pits, medial, very mobile linear, vertically oblique. Feet-pits large in all 4 feet. Inguinal pits, large and clearly defined. Calcic tufts? Mammæ two Type Cervicapra. Black Antelope. Barant and sasin. Very gregarious on the open dry plains of India generally.

Gazella.—Ghazal. Horns in both sexes. No mufles. Eye-pits distinct mobile. Feet-pits very large in all 4 extremities. Inguinal pits large and distinct. Calcic tufts? Mammæ two. Type Dorcas. Foreign to India.

Tragops.—Chikara, Kalsipi. Horns in both sexes. No mufles. No eye-pits. Feet-pits large in all 4 feet. Inguinal pits distinct. Calcic tufts postcal. Mammæ two. Type, Antelope bennetti vel christii, found generally amid ravines of dry plains of India, called Chikara and Kalsipi by natives; Ravine Deer by Europeans. Not gregarious. These animals have the lyrate horns common to both sexes, the knee tufts, lines along the flanks and ovine hairy nose of the Gazelles; but they are wholly void of eye-pits. The dark lustre of their large eyes is as striking as in the two last

groups. This is one of the marks by which the Antelopine family may be distinguished from the small pale-eyed Goats or Caprine family. Gazelles differ from Antelopes in that their horns are lyrate, and that the females also carry them. The Tragops differ from both by the total absence of the sub-orbital sinuses, or eye-pits.

Pantholops.—Chiru. Molar teeth $\frac{3}{2}$ Horns in males only. No mufles. No eye-pits. Feet-pits large in all 4 feet. Inguinal sacs, purse-like, large, pendent. Calcic tufts? Mammæ, two. Large intermaxillary sacs like double nostrils. Type, Antelope hodgsonii, Abel. The Chiru. Habitat open plains of Tibet. Gregarious, rutting season, winter. Breeding season—the summer. Gestate 6 months. One young at a birth. They are very pugnacious and jealous, and in their contests often break off one of their long horns. Hence the rumour of Unit corns in Tibet.

Procopra.—Goa and Ragoa. Horns in males only. No mufles. No eye-pits. Feet-pits small in all 4 feet. Post cornual sinus, large. No inguinal pores. Calcic tufts postcal. Mammæ two. Type, P. picticaudata. Goa of Tibet. Inhabits ravines on the open plains of Tibet in small herds or families.

Kemas.—Goral. Horns in both sexes. Mufles media No eye-pits. Feet-pits medial in all 4 feet. No groin-pits. Calcic tufts? Mammæ four. Type, Antelope Goral. The Goral; inhabit the Sub Himalaya, as far towards the snows as the great forests extend, to which exclusively these animals adhere. Dwell in families 4-6 together. Breed amid crags and rocky recesses. Young mostly born in May, June; gestate 6 months. Rutting season January, February. Produce one young at a birth.

Nemorhædus or Capricornis.—Sumatrensis is Col. Smith's type and Mr. Ogilby says this is identical in structure with the Thar, Mr. O.'s type of capricornis. If so Col. Smith's generic name will have priority; if not, it will be the type of Nemorhædus and the Thar of Capricornis. Col. Smith's several species of Nemorhædus are as heterogeneous as Mr. Ogilby's of Kemas.

Thar or Saraw. Horns in both sexes. Mufles medial. Eye-pits round and furnished with a very large gland. Feet-pits extremely large in all 4 feet. Groin-pits none. Calcic tufts none nor gland. Mammæ four. Type, Antelope thar, the thar or Saraw. Habitat the Sub-Himalaya as far north as the great forest extend. Also, Antelope Sumatrensis of the Islands of India. The Goral and Thar have the round black and ringed horns of the Antelope, which otherwise

they little resemble being short clambering mountain animals, but not, as supposed, affined to the Bovines. The Goral differ from the Thar by wanting the very glandulous eye-pits of the latter, and both are sundered from the Hemitragas by their large feet pits, Antelopine horns, and absence of Caprine odour. The Thar are not gregarious at all. They rush with fearful precipitancy down the steep mountains they inhabit. Rutting season, February, March. Young (one) born in September, October. Gestate 8 months. Small gut 65 feet. Great 32 feet Cœcum 15 inches long by 3 wide, and simple. Gall-bladder constant.

Capridae.—Goats and sheep; Bakaradi. Occipital plane of skull forming an acute angle with frontal plane. Cores of horns thick, porous and cellular. Horns seated superiorly on the crest of the forehead and by their union covering the top of the head. Canines wanting. Teats normally but two, rarely 4. Mufle abnormal and almost invariably absent. Feet-pits in all four feet or only in the fore-feet, or none. Eye and groin pits present or absent.

Hemitragus.—Jharal or Tehr. A small mufle. No eye-pits. No feet-pits. No inguinal pores. Calcic tufts. Four teats. Strong caprine odour in males. Types. 1, *Capra jemlaica*. 2 *Capra jharal vel Quadrimammis*. 3, *Capra waryatu*, whose female is *Hylocrius*. Habitat the loftiest mountains of India: the Sub-Himalaya near the snows and the highest part of the Nilgiris. A very remarkable type tending to connect the keeled, compressed hollow-horned and odorous goats with the deer family which want these marks, but possess the mufle and 4 teats of the Hemitragas, marks of which the true goats (and sheep) are void. The Jharal's retreats are among the most inaccessible bare crags of the Hemachal, close to the perpetual snows, beyond the forests. They feed in the open glades below such crags at early morning and evening, retiring in the day to their awful fastnesses. They are gregarious and the flocks often amount to 40 or 50 animals, but generally do not exceed 20 or 30. If alarmed when feeding they go off at speed with a noise like thunder, but anon halt to gaze on the intruder, whose shot sends them off again under the guidance of an old male whom they all follow blindly. The rutting season is the winter. The females gestate 6 months and produce usually but one young in the months of June, July. The habitat and manners of the wild sheep are very similar to those of the jharal, only the latter are still more dauntless and skilful climbers. If they can but touch a rough edge or crevice now and then they will run up nearly perpendicular precipices of many feet elevation and they will stand on a bit of

rock not larger than one's palm looking confidently down over sheer space with not a shrub to break the awful absence of rest for the foot. In February 1842, a male jharal in possession of the court of Nepaul had intercourse with a female Axis, which in July produced a young hybrid of mixed appearance, but more like the mother than the father, and which lived and grew up a fine animal. Hodgson saw it last in October 1843, and notes the circumstance as a strong corroboration of that affinity of the Hemitragas to the Deer (not Bovines as Mr. Ogilby supposed) which is indicated by the 4 teats and moist muzzle of the former, notwithstanding that the Hemitragas in all other parts of their structure as well as in their rank odour and in their manners are such perfect goats. From the true goats however they differ, besides grand points noted, by the total absence of beard and of feet pores. Nor could he ever get any progeny from the goats by the jharal. They copulated freely and he was told would breed. Hence the erroneous statement in the Journal for September 1835, disproved by experiments, though a male of the latter species had commerce with goats of several breeds, repeatedly, during the 6 years he was kept, quite tame and going abroad with the sheep and goats. Small intestines 53 feet. Large, 25-78 feet. Cœcum 1 foot long and $2\frac{1}{4}$ inches wide. Small gut $\frac{3}{4}$ inch in diameter; great gut $2\frac{1}{2}$. Cœcum simple, that is, not banded nor sacked.

Capra.—Bakra, Goats. Horns in both sexes. No mufle. Feet-pits in the forefeet only or none. No inguinal pores. Mammæ two. Odour intense in males. Calcic tufts none. Type, *Capra ægagrus*. Habit Persia. Foreign to India, and not therefore subject to Hodgson's examination, but the several tame races of Tibet and the sub-Himalaya (Chandra, Chyapu, Sinal) and also the common Goats of the plains (Dugu and Jamnaparia) are all typical. These animals are further distinguished by horns inserted very obliquely, not angular, compressed, and presenting a sharp keeled edge to the front, whereby they may be distinguished at once from all kinds of sheep and also from the Ibexes. They have likewise invariably a true beard, common to both sexes, as have also the Ibexes, but the sheep never: and, lastly, the Goats have callosities on the chest and knees or knees only. Eminently bold, saucy and scendant. Gregarious. Rut in winter, Procreate in summer. Gestate under 5 months? Produce 3, 2 or 1 young at a birth.

Ibex.—Skin. Kin. Horns in both sexes. No mufle. No eye-pits? Feet-pits none? No inguinal pores? Mammæ two. Odour in Males?

Calcic tufts ? Types. *Europea caucasica*, *Jaela* : *Sakin Sibirica*. Habitat, the loftiest mountains of Europe, Asia, and Africa. Found in the Himalaya close to the snows. These animals with the general manners, the odour and the beards of goats, are distinguished invariably by angular horns presenting a distinct surface, instead of a mere edge, to the front, thereby differing from the goats proper and approximating to the sheep. The front of the horns is likewise remarkably nodose, and the horns are of great size and sickle-like curved. Their structural peculiarities want testing and will doubtless show deviation from the type of *Oegragus*. Rut in autumn. Breed in spring. Gestate $5\frac{1}{2}$ months. Produce 2 or 1 kids. Gregarious, bold, and scindent.

Ovis.—*Bhera*. Sheep. Horns in both sexes. No muffle. Eye-pits large but immobile. Feet pits small but present in all four extremities. Inguinal glands distinct. Pores vaguely defined. Calcic tufts and glands none. Mammas two. No odour in males. Types, *Ovis Ammon* or the *Argali* of Siberia, and *Ovis Ammonoides* or the *Argali* of Tibet. Habitat the snowy barriers of high Asia, *Ammon* being confined to the remoter, and *Ammonoides* to the nearer ranges. These animals are further distinguished as a group by angular, compressed, heavily wrinkled horns turned almost into a perfect circle, and their flat points directed forwards and outwards; by very short disced tails; and by the absence of beard. The wild sheep proper, or *Nyen* of the Tibetans, never mix with the *Nahoor*. They are far more hardy, active and independent than any tame breeds of their kind, as may well be supposed from their terrific abode amid the snowy peaks of *Hemachal*. They are gregarious, feed in the glens, seek refuge on the tops, and leap and run with deer-like power, though as climbers inferior to the *Hemitrages*, and as leapers to the *Musks*. They are often snowed up for days without perishing, unless their breathing holes should betray them to man, a more terrible foe, than the direct clemency of the seasons! They rut in winter, breed in early summer and gestate, it is said, 6 months, probably not above 160 days. The *Nyen* or *Ban Bhera* (that is, wild sheep) seldom or never cross the *Hemachal*, the Indian side of which range is the special habitat of the *Nahoor*, while to the north and west beyond Tibet, our animals are replaced by other species, so that Tibet may be considered as the special habitat of one species and the plateaux north of Tibet as far as the *Altai* as that of the other species, above cited as types of the true ovine form, and it may here be added that the six sorts of tame heep of Tibet and the Sub Himalayas, all, with-

out exception, exhibit the essential characters of that form.

Pseudois, [*B. A. S. Jour. No. 173*].—*Nahoor*.—Horns in both sexes. No muffle. No eye-pits. Feet-pits small in all four feet. Inguinal glands distinct. Pores vague. Calcic tufts none. Mammas two. No odour in males. Types, *Ovis nahoor* and *Ovis barhel*. Habitat, the Himalaya. These animals are contradistinguished, besides the want of eye-pits, by rounded uncompressed smooth horns directed upwards and backwards with great divergency and their round points again bent inwards; by short-deer like tails, but longer than in the last and undiaced; and, lastly, by the absence of anything like mane or beard. The *Nahoor* rut in winter, breed in summer and gestate $5\frac{1}{2}$ months. Their manners, so far as known, resemble those of the *Nyen*; but the two never commingle nor approach each other, nor will the males, how long and completely soever they may be tamed have sexual commerce with domestic sheep. Great gut 24 feet. Small gut 50 feet. Cæcum 17 inches, by $2\frac{1}{2}$ wide. Large gut near it, of same diameter. Liver 2 lobes each subdivided and a lobulus. Ribs 13 pairs.

Caprovius.—*Moufflons*. Horns in the males only. No muffle. Eye-pits small but distinct. No interdigital pits. Inguinal gland? pore? No calcic tuft? Mammas two. No caprine odour. This is the only form not verified by Mr. Hodgson, he was indebted to the Prince of Canino for its characters. Further distinguished by horns bent into a half circle over the back, heavily wrinkled, angular and compressed, by deer-like tails, no beard nor mane nor caudal disc. Type, *Ovis musimon*. The *Moufflon*. Habitat Corsica. Sardinia. The 'Muffle' is the naked moist skin round the end of the upper lip and nostrils seen in perfection in the ox. The eye-pits are slits or punctures on the cheek, just below the eye. They are round or linear and elongate; and, if the latter, are curved or straight and can be turned almost inside out, are partially or wholly immobile. The 'foot pits' are punctures in front of the pastern, in the cleft between the two bones. The 'groin-pits' are fissures in the groin more or less defined in outline, and furnished with glands which secrete a fragrant viscid substance very like the secretion of the other sinuses. The calcic glands are placed on the stifle, inside and outside, or only the one, and are often naked and tumid externally. There is a whorl or callous nude spot in many quadrupeds at its side. The tail gland of the musks is very large and covers the whole tail nearly, and has a linear longitudinal pore on each side and an abundant secretion. The preputial gland of the musks is analogous

to that of the civets and screwtail (*Paradoxurus*, vulgo, Malwa). It is placed on the prepuce, the penis opening in the midst of it. This organ is clearly subservient to sexual purposes, and so probably are several of the others, though the eye-pits have been variously referred to the facilitation of breathing and of smelling. The supposed end of the interdigital gland and pore or feet-pits, viz., the lubrication of the foot and preservation of the hoof in hot sandy deserts, is clearly erroneous, since the Thar has these organs of an enormous size in all 4 extremities, though it be the tenant of moist cool mountain forests. It is probable that the secretion from the foot pores enables these animals to find one another in those wildernesses of vast forest trees and dense undergrowth which constitute their range. The shape of the orifice and of the gland, and the nature of the secretion from the latter as well as the periodical augmentation thereof, should be closely attended to—and that generally, or with reference to all these pits or sinuses. The distinctive form of the upper outline of the skull, and character of the core of the horns in the Antelopidæ or Antelope kind, and in the Capridæ or goat and sheep kind, and again in the deer kind and ox kind, sketches will be better understood; and Mr. Hodgson suggests particular attention to this point as a key, as well to the mutual affinities as to the differential characters of all these groups. The Antelopes are thus clearly separated from the goats and sheep, and distributed into two groups of their own, one that of the typical genera which class with the flocks; the other, that of the abnormal genera, which range with the herds.—He does not discuss the last named group or Bovine Antelopes (*Bes dorcidæ*): but in regard to all the others, inclusive of the Musks whose Cervine affinities are, he thinks, palpable, he directs special attention to the signal and abrupt fall of the postæal plane of the skulls in the Caprine and Bovine Families; and its gentle slope in the Cervine and Antelopine Families. The Antelopine skull depicted is that of the Thar, and it will be seen at once that this type (as well as *Kemas*) which agrees with *Nemorhædus* in this important point) is an Antelopine not Bovine type. [The agreement is not close, so that Goral is osculant towards the Capridæ. The characters of both were printed by me (*Journal*, September 1835) a year and quarter before Mr. Ogilby, December 1836, *Zool Jour.*] In like manner that is by attending to the form of the skull and the consequent position of the condyles—you may obtain demonstration of the caprine affinities of *Hemetrages*; and, in fact, the whole genera of these perplex-

ing families may thus be set in order. The Bovine or ox-kind.

Cavicorniæ majores, or Bovidæ or herds.—Gaudrihsa, Hoofs cloven. Occipital plane of skull forming a large angle with frontal plane. Horns hollow, persistent, sheathed with a thick cellular core springing laterally from the apex of the forehead. These marks of the family may be supposed exclusive to the sub family: but Mr. Hodgson apprehends that they will serve usefully to sunder the antelopes allied to *Bos* and those not so allied, or Antelopidæ and *Bos dorsiniæ*. Mufe large. Front teeth, above, none. Below 8 canine none? Molars 4. Teats four. Dewlap present or wanting.

Boviniæ or Ox-kind.—Gauadi. Occipital plane of the skull forming a large angle with the frontal plane. Core of the horns massive and very porous or cellular. Horns in both sexes, inserted laterally on the apex of the frontal crest. Canines none; Mufe very large. Teats invariably 4. Dewlap in most, normally. No eye-pits. No feet-pits. No groin-pits.

Bos. Oxen.—Gau. Cranium moderate, compressed, proportional or with excess in the cerebral or facial region. Frontals shorter than the face, flat, and not border than long. Occipital plane of the skull square, never arched along the ridge line nor indented by the temporal pits, smaller than the frontal plane and forming an acute angle therewith. Condyles of great foramen and of lower jaw, elevated greatly, and the jaw much curved. Horns attached to the highest line of the forehead, rounded, curved up or down or forward ascendantly. Orbits not salient. Thirteen pairs of ribs. No true dorsal ridge, but sometimes a fleshy hump. Mufe very large and square. Dewlap great. Type *Bos domesticus*. Gau.

Gaveus. Gavi or Gabi.—Cranium large, having the ample flat forehead as long as the face and broader than long, but not ridged nor curved along its crest. Occipital plane equal to the frontal plane and moderately indented subcentrally by the temporal fosses, square, and forming an acute angle with the frontal plane. Condyles of great foramen and of lower jaw low, and the jaw little bent. Orbits not salient. Horns attached to highest line of forehead, more or less depressed, and angular, and directed upwards and outwards with little curvature. A true dorsal ridge but confined to the withers. Mufe moderate. Dewlap moderate. Thirteen pairs of ribs. Type. *Bos frontalis* vel *Gaveus* vel *Sylhetanus*. The Gavi or Gabi. Habitat, trans *Brahmaputra*, the forests under the ranges extending from Assam to the sea. The *Senbar* or *Phain* may probably be a

second species : and *Bos Sondaicus* or the Benteng, a 3rd and the insular species ; but these want testing. The first is more than half redeemed from the wild state like the yak of Tibet. The others are entirely wild. Mr. Hodgson possessed no memoranda of the soft anatomy or intestines, nor of the breeding season and gestation.

Bibos.—Gaur or Gauri Gau. Cranium large, massive, with the frontal and cerebral portions preponderant over the facial. Frontals as long as the face, broader than long, concave and surmounted by a salient arched crest. Occipital plane spheroidal, very large, larger than the frontal plane deeply indented centrally by the temporal pits, and forming an acute angle with the frontal plane. Orbits salient. Condyles of great foramen and of lower jaw low, and the latter straight. Horns attached below crest of forehead, sub-depressed, sub-angular, and curving ascendantly. Thirteen pairs of ribs. Dorsal ridge co-extensive with the ribs and of great elevation. Mufle small. Dewlap small. Type *Bos gaurus* vel *cavifrons*. The Gaur or Gauri Gau, Cæsar's wild Bull of Europe, and Aristotles of Persia, are two other species of *Bibos* or of *Gaveus*, which might be respectively called *classicus* vel *Cæsaris* et *Aristotelis*. The Gaur cattle inhabit the primitive forests of India generally, under the great ranges of mountains, such as the sub-Himalaya, the Vindhia, the Satpura, the Ghaut, Eastern and Western and their links with the Vindhia, and with the Nilgri. Beyond the Brahmaputra, *Bibos* is replaced by the last type, of which there would seem to be two species in the Indo-Chinese countries, one of them extending to Ceylon, if the Lanka wild ox be not rather a *Bibos* ; Mr. Hodgson supposed that there might be at least two species of *Bibos*, as of *Rusa*, inhabitants of India between Cape Comorin and the sub-Himalaya or *B. Gaurus* and *B. Cavifrons*. In Nepal the period of gestation was always stated to exceed that of the common ox ; but Mr. Elliot, will not allow this. The Gaur rut in winter and procreate in autumn, producing usually but one young at a birth. The herds are ordinarily rather numerous 20, 30, 40, and sometimes even double these numbers, being found together, but in the breeding season, not above 10 or 15 cows with a single mature vigorous bull, who jealously expels every young and old male from his herd. The sub-Himalayan species entirely avoids the open Tarai on the one hand, and the hills on the other, adhering to the most solitary parts of the Saul forest, close to and between the salient spurs of the hills where the periodical firing of the under growth of the forest never reaches. In the Deccan, these animals are said to penetrate

into the hills in the hot weather very partially, or else they must then lack cover on the plain, for they are not a mountain race at all. They feed early and late, in the more open glades of the forest, posting sentinels the while and manifesting in their whole demeanour a degree of shyness unparalleled among the Bovines. They never venture, even in the rains, when there is abundance of most rank vegetation to cover their approaches, into the open Tarai to depredate on the crops, as the wild buffaloes constantly do, nor do they ever associate, or have sexual commerce with the tame cattle, though immense numbers of the latter every spring are driven into their retreats to feed, and remain there in a half wild condition for three or four months when the wild buffaloes frequently have sexual intercourse with the tame ones of their kind, of which likewise vast numbers are depastured there. Old males of the Gaur are often found solitarily wandering the forests they frequent especially in winter : but these have probably been recently expelled the herds by their more vigorous juniors, and re-unite themselves with some herd after the season of desire and contention has passed. It is exceedingly difficult to rear the Gauri Gau in confinement. Nor had Mr. Hodgson ever known a successful experiment, though the attempt had been, for 50 years past, constantly made by the Court of Nepal, which finds no difficulty in rearing wild buffaloes and causing them to breed in confinement with the domestic species, which is thus greatly improved in size and qualities. From the excessive shyness of the Gaur, when approached, they will retreat so long as they can : but if compelled to stand and defend themselves, they do so with a courage and determination not to be surpassed. Their beef is unequalled for flavor and tenderness . but to the aborigines only it is illicit food, though not to all tribes of them, nor are any of them allowed to kill the Gaur in hindu kingdoms. The Gaur stands from 6 to 6½ feet high at the shoulder, and is either of the ruddy brown, called tan, or of a black colour, the forehead and limbs below the mid flexures being pale, and the forehead and knees tufted. Capt. Tickell believes that there are two species of *Bibos* in the Chota Nagpore territories alone !

Bison.—Yak or Chouri Gau. Cranium moderate, depressed, with the facial portion exceeding the frontal and cerebral parts. Frontals broader than long, convex and forming an obtuse angle with the occipital plane. Occipital plane smaller than the frontal plane, trigonal or semi-circular, and ridged by the parietes. Orbits salient. Condyles of great foramen and of lower jaw low ; and jaw

straight. Horns attached below; the curved or bent inter-cornual ridge, rounded and curving out of the horizontal line. Ribs 14 or 15 pairs. A true dorsal ridge, confined to the withers. Muzzle small. Dewlap none. Types, *Americanus* et *Pomphagus*. The latter is the Yak or Chouri Gau. It inhabits all the loftiest plateaux of High Asia between the Altai and the Himalaya, the Belut Tag and the Peling mountains, and is found wild as well as tame. It cannot live on this side the Himalaya beyond the immediate vicinity of the snows, where the tribes of the Cachar or Juxta-nivean region of the sub-Himalaya rear large herds and cross-breed with the common ox. The yak ruts in winter and produces young in autumn, after the usual period of Bovine gestation. Small intestines 107 feet. Large 33 feet. Cæcum $2\frac{1}{2}$ feet. Width of small gut $1\frac{1}{2}$ inches; of great, 2 inches; of Cæcum 4 inches. Cæcum simple, that is not saccated not banded.

Bubalus.—*Bhainsa* or *Arna* Cranium large, elongated, compressed, exhibiting great excess in the facial over the frontal and cerebral portions. Frontals short, narrow-convex, forming an obtuse angle with the occipital plane. Occipital plane larger than the frontals, spheroidal moderately indented. Condyles of the foramen and lower jaw low and the jaw little curved. Horns attached to the highest line of frontals, depressed, angular, and horizontal. Thirteen pairs of ribs. No true dorsal ridge nor hump. Muzzle very large and square. Dewlap medial. Types. *Bubalus bubalis* or the *Bhainsa*, and *Bubalus Arna* or the *Arna*. *B. Bornouensis* and *Brachycerus* are to Mr. Hodgson, no buffaloes, and their united horns form a character at variance not only with the genus but the family. Hence he denominates them from this feature *Syncerus*. They are foreign to India, the land of the true buffaloes. Habitat of the tame, universal; of the wild, also every place where adequate cover and swamp exist. The haunts of the *Arna* or wild Buffalo are the margins rather than the interior of primeval forests. They never ascend the mountains, and adhere, like *Rhinoceroses*, to the most swampy sites of the district they frequent. There is no animal upon which ages of domestication have made so small an impression as upon the buffalo, the tame species being still most clearly referable to the wild ones at present frequenting all the great swampy jungles of India. But in those wildernesses as in the cow houses, a marked distinction may be observed between the long-horned and curve-horned Buffalo, or the *B. Macrocerus*, and *B. Speirocerus*, *Hodgs.*—The length of the horns of *B. Macrocerus* is sometimes $6\frac{1}{2}$ feet each. The *Arna* ruts in

autumn and the females produce one or two young in summer after a gestation of 10 months. The herds are usually numerous and sometimes exceedingly so, though at the rutting season the most lusty males lead off and appropriate several females with which they form small herds for the time. This noble species is, in the Saul forest and Tarai, a truly stupendous animal, as tall as the Gaur and longer considerably, and of such power and vigour as by his charge frequently to prostrate a well sized elephant. The wild animals are fully a third larger than the largest tame breed, and measure from snout to vent $10\frac{1}{2}$ feet, and six to six and half feet high at the shoulder. The wild Buffalo is remarkable for the uniform shortness of its tail, which extends not lower than the hock; for the tufts which cover its forehead and knees, and, lastly, for the great size of his horns and the uniform high condition of the animal, so unlike the leanness and angularity of the domestic buffaloe's figure, even at its best.

The Bovine Antelopes form another sub-family of the Bovidae. But those animals,—with one exception, and that a doubtful one, viz. *Portax picta* or the Nilgau—are wholly foreign to India and the Nilgau itself rarely found on the left bank of the Ganges, how common soever across that river all the way to the Carnatic.—*Mr. B. Hodgson in Beng. As. Soc. Journ. Beng. As. Soc. Journ. Nos. 2; 27; 45; 87; 118; 173; Beng. Sporting Magazine, June 1847. Gleanings of Science No 84. Jerdon's Mammals.*

RUMI. ARAB. Sand. The method of divination by it is scattering a quantity on a board, over which certain ceremonies have been performed, and then reading the characters. The person thus officiating is called *Rummal*. *Qoorua* or *Kooruh* means a lot, and means a form of divination. It is practised in different ways, but most frequently by bones of a dead man cut in the shape of dice, and marked with hieroglyphic characters. These are thrown by the person wishing to know his destiny, and the fortune-teller explains the result.—*Pottinger's Travels, Beloochistan and Sind, p. 154.*

RUMMAS. PORT. Pomegranate.

RUMMEL OOL JUMAR. The throwing of a gravel, a ceremony.

RUMNAH. HIND., A grass preserve.

RUMNAH GRASS. See Graminaceæ.

RUMNAY-WALAY. Mohurruq faqir.

RUMOM PAIO. MALAY. *Punica granatum.*

RUMPH, George Everhard, native of Hanau, a small town of Hesse Cassel, was born in 1626 and died in Amboyna, in 1693. He studied medicine and went to Batavia, when 28 years old and entered the service of the

Dutch East India Company at Amboyna, where he passed the remainder of his life. At the age of 42, when contemplating a visit to his native country, he suddenly became blind, and, therefore never left his island home. But he continued to prosecute his favourite studies in Natural History till his death in 1693, when he had attained the age of 67. His great work on the shells of Amboyna was not published till 1705. His chief work, however, was the *Hortus Amboinense* which was only rescued from the Dutch archives and published some years after his death. D'Amboinische Rareit Kamer, folio, 1705 has passed through several editions. It has never been translated into English. It contains all connected with the plants of that region. Another account states he was born at Hanau in 1637, and died 1706 and he lost his sight at the age of 43. Drs. Hooker and Thomson say the materials of the *Herbarium Amboinense* of George Everhard Rumphius, a native of Hanover, a physician and a merchant, and afterwards consul of Amboyna, were principally collected by himself, and drawings and Latin descriptions made at the time. Having afterwards become blind, he obtained the assistance of some young men in completing the work, and translated the descriptions into Dutch: it was finished in 1690. Rumphius died in Amboina in 1706, from which time the manuscript remained upwards of thirty years in the possession of the Dutch East India Company, but was at length rescued from oblivion by professor John Burmann of Amsterdam, who not only edited it between the years 1741 and 1754, but has illustrated it with several remarks and synonyms, besides giving a translation into Latin, for Rumphius' original one appears to have been lost. This work consists of 6 volumes, with a supplemental or seventh one not published till 1757, and contains 696 plates, representing more than twice that number of plants. The plates are much less valuable than those of Rheede, but the descriptions on the contrary are much superior. Most of the plants are to this day very little known, a most elaborate commentary on the *Herbarium Amboinense* was commenced by the late Dr. Francis Buchanan Hamilton, in the transactions of the Wernerian Society of Edinburgh; what is printed only extends to the middle of the 2nd volume, but the remainder of the manuscript was presented to the Society before his death, he had at the same time prepared a commentary on the *Hortus Malabaricus*, which we believe is in the possession of the Linnean Society of London: that on the four first volumes is all which has yet appeared in their transactions. From

both these commentaries much useful information may be derived, particularly from the latter, from Dr. Hamilton having himself explored a considerable portion of Malabar, as well as the contiguous province of Mysore.—*Wight's Prodromus Flora*, Vol. I. p. 8.

RUMPHIA. A genus of plants named by Linnaeus in honour of George Everhard Rumph. Messrs. Wight and Arnott remark, that as each apparent stamen may be composed of several filaments, this doubtful genus would be brought near Byttneriaceæ.

RUMPA, a tract of country situated on a part of the northern frontier of the Rajahmundry District. It is very thinly populated, wild, and mountainous, and the climate, during most part of the year, unhealthy. It formed part of the old Kottapille taluk which, under the new territorial arrangement of the District, was included under Rajahmundry, with a Sub-Magistrate, however, resident, not far from the Rumpa border.

RUMPAT-RUMPAT. MALAY. Spices.

RUMUL. HIND. of Kaghan; *Ficus Roxburghii*, F: macrophylla.

RUMZAN. The ninth month of the mahomedan year, during which these religionists fast from sunrise to sunset. Breakfast is from 2 to 4 A. M.; and during the fast, eating, drinking, and conjugal intercourse are interdicted, as also chewing betel leaves, smoking and snuffing.—*Herkl.* See Eed; Mahomed; Month.

RUMZAN KI EED, or Eed ool fitr, the feast of the Ramzan.

RUMZAN KA ROZ, or the mahammadan Lent.

RUN. HIND. See Rui.

RUNA, also Runang. HIND. *Rubia cordifolia*.

RUN. A group of small islands, consists for the most part of high rocky ground. Some of the cliffs lying close to it are completely bare.—*Jour. of the Ind. Arch. June 1852*, p. 324.

RU-NAS. PERS. Madder.

RUND. A plantation reserve. See Rakh.

RUNDUR or Kyampo, lawless tribes of independent robbers in the middle districts of Tibet.

RUNEKA. See Rama.

RUNG-MAKHUN-SHIM. BENG. *Canna-
valia erythrosperma, flore rubro.*

RUNGPOOR NEBOO. BENG. *Citrus bergamia.*

RUNGPUR taken from the Burmese, 21st February 1825, is a marshy district to the south of Kooch Bahar. It produces silk corahs, Megilli cloths made of pat (*Corchorus olitorius*) ginger (the best in Bengal), and tobacco of an excellent quality: from the neighbouring country of Bhotan, is imported the beautiful long glossy hair of the tail of the yak of which chowrees are made.—*M. C. C.* See China grass; Kocoh.

RUNGRU. HIND. *Kalanchoe* varians.

RUNGUN. BENG. *Ixora bandhuca.*

RUNJANA. SANS. Sanders wood.

RUNJIT SINGH, the greatest leader of the Sikhs, His rise commenced after the departure of Shah Zeman, and from 1801 he gradually extended his power. He made Lahore his capital. In 1806, he first entered into a vague but friendly alliance with the British. Before the close of his long life, in A. D. 27, June 1839, he had succeeded in moulding into one nation the various conflicting interests and peoples over whom his conquests extended. Runjeet Singh was of small stature. When young he was dexterous in all manly exercises but in his old age he became weak and inclined to corpulency. He lost an eye when a child by the small pox, and the most marked characteristic of his mental powers was a broad and massive forehead, which the ordinary portraits do not show. From tracts of country which the Sikhs subdued but did not occupy Rok-kee, literally, protection money, was regularly levied. The Roklee, varied in amount from perhaps a fifth to a half of the rental or Government share of the produce. It corresponded with the Mahratta Chout, or fourth, and both terms meant black mail, or, in a higher sense, tribute.—*Cunningham's History of the Sikhs* p. 113.

RUNJUDEB. PERS. *Sarcocolla.*

RUN-KA-DOLA, lit. the war-bier a ceremony.

RUN-KA SHARBAT, lit. the war-lemonade.

RUN-KA TABOOT, see Runka Dola.

RUNKINI, an incarnation of Kali, when she ran away from Pocheto.

RUNN, a flat tract of morass lying between Sind and Cutch, which is inundated with brackish water during the three monsoon months. It varies in breadth from 5 to 8 miles and is covered by salt incrustations when dry. Salt is manufactured on it at Janjorra and Patri. The Run or Rinn, is a remarkable

feature of the Rajputanah desert. It is 150 miles broad, into it the Looni or Looni or salt river enters and then runs on to the sea. d The Looni rises in the Aravalli. In Marwar it separates the fertile land from the desert, afterwards runs through the Chohan territory, dividing it into the eastern part called Raj-Bah or Sooi-Bah, and the western part called Parkur or "beyond the Khar or Looni." The Caggar rises in the Siwalik Hills, flows under Bhutnair walls and once emptied itself between Jessulmeer and Rori Bukkar. The Runn of Cutch during the monsoon is a shallow brackish lake from four to sixty miles broad, but it dries up during the hot season and is then covered with grass. The climate of the outposts is dry and in the hot season stimulates to irritability. The thermometer rises to 100° in the shade; part of Cutch is an irregularly hilly tract completely isolated by the Runn and the sea. On the southern coast the country is a dead flat covered with rich soil, but the northern part has three distinct ranges of hills running from east to west. The central of these ranges consists of sandstone, beds of coal, limestone, and slate clay; the hills north of it consist of marine remains, and those on the south and all the face of the country near them, are covered with volcanic matter. Cutch is 165 miles long and from 15 to 52 miles broad and, not including the Runn, has an area of 6,100 square miles. Its immense salt-marsh, the Runn, upwards of one hundred and fifty miles in breadth, is formed chiefly by the Looni, which, like the Rhone, after forming Lake Leman, resumes its name at its further outlet, and ends as it commences with a sacred character having the temple of Narayn at its embouchure, where it mingles with the ocean, and that of Brihma at its source of Poshkur. The word Runn, or Rin, is a corruption of Aranya, or 'the waste;' nor can any thing in nature be more dreary in the dry weather than this parched desert of salt and mud, the peculiar abode of the Khur-gudda, or wild-ass, whose love of solitude has been commemorated by an immortal pen. That this enormous depository of salt is of no recent formation, we are informed by the Greek writers, whose notice it did not escape, and who have preserved in Erinos a nearer approximation to the original Aranya than exists in our 'Rin' or 'Runn.' Although mainly indebted for its salt, to the Looni whose bed and that of its feeders are covered with saline deposits, it is also supplied by the overflowings of the Indus, to which grand stream it may be indebted for its volume of water.—*Tod's Rajasthan, Vol. II. p. 289, 295, 330.* See Cutch; India; Jut.

RUPA. HIND. Silver, but generally used to

mean alloyed or impure silver, debased by the addition of copper or zinc, or both.

RUPA-MATI, was born at Sarungpur, a town in Malwa 55 miles N. E., of Oujein and 80 miles west of Bhilsa. Malcolm describes her as a dancing girl, and famed more for her good sense than her beauty. Malwa for a short time in the middle of the 16th century became independent under Baz Bahadur, and he made Rupamati one of his wives, and they passed through seven years of great happiness, hawking in the day, with poetry and music at night. But in A. D. 1560, Akbar sent Adam Khan to re-occupy Malwa, and Baz Bahadur deserted by his soldiers fled. Rupamati destroyed herself by poison or the dagger. Her songs are in the hindi dialect of Malwa. Their style is simple and natural and are the outpourings of a fervent heart and many of them are still sung by professional songsters and musicians all over the province of Malwa. They are composed in Malwa dialect of Hindi. She had more than a common share of the poet's power.—*r. of Hind., Vol. II, p. 198.*

RUPAMAKHI. HIND. Iron pyrites. See ona Makhi.

RUPASIDDHI. See Pali.

RUPEE, a coin of India, value about 2s. The Sicca rupee, the Madras or Arcot rupee and the Bombay rupee have been displaced from British India by the Indian rupee of 1834.

RUSOT. HIND. Extract of Barberry.—

Berberidis extractum—extract of the bark and wood of the Barbery, (*Berberis*) several species; deep yellow colour, totally soluble in water. It is the *Lykionendikon* of Dioscorides.—*Beng. Phar.*

RUSS. See Kashgar.

RUSSA-PUSPUM, one of the mercurial preparations of India.

RUSSELL. Dr. Patrick, a Madras medical officer, in the service of the E. I. Co. who succeeded Koenig as Botanist to the E. I. Co. He devoted much time to the investigation of snakes and fishes, and edited Roxburgh's *Coromandel Plants*. Prior to that, in 1802, there had appeared Dr. Patrick Russell's book in two volumes, containing the descriptions and figures of 200 fishes collected at Vizagapatam on the coast of Coromandel.

RUSSELIA. This plant, with rush like branches, one of *Scrophularinæ* bears a deep scarlet trumpet shaped flower, hanging in long axillary peduncles down the stalk. It blossoms during the greater part of the year, and is highly ornamental, growing luxuriantly in a rich soil. It is propagated by layers or cuttings.

RUSSI. HIND. Cordage. rope.

RUSSIA, a great dominion in Europe and Asia, ruled from St. Petersburg. The historical and geographical future of Russia impels her farther and farther towards the south, in spite of all obstacles; and yielding to these natural impulses, she has advanced, on one side, from the Irtysh to the upper course of the Syr-Daria or Jaxartes and Amu Daria or Oxus; on the other, from Orenburg to the Sea of Aral, thus incorporating within her boundaries the greater portion of the steppes dividing Europe from Asia Proper. A necessity arose for connecting her Central Asia settlements firmly together, and with this object roads were constructed, stations erected, steamers introduced, as on the Amur and Syr-Daria, and even telegraphic lines established, as at present from the Chinese frontier to St. Petersburg. The Amu-Daria is for many reasons of greater importance to Russia than even the Syr-Daria. It disembogued at one period into the Caspian, and its bed to that sea still remains. Some are of opinion that the course of the river can be again directed to its ancient bed, while others consider it impossible to do so. The importance of this connection will readily be understood when it is remembered that a water route, in continuation of the Volga, will be thus created, which will extend for 3,000 versts into the interior of Asia, and that the extreme points of this uninterrupted water-way will be St. Petersburg and the Northern slopes of the Hindoo Koosh, almost reaching the boundaries of the

British possessions, and very closely approaching the Indus. The number of Turkman, Kirghiz, Kasak and other nomad hordes in Central Asia is computed at three millions and the settled population at more than five millions. The quantity of gold obtained in the khans of Bokhara and Kokan is so small that the inhabitants of the different Central Asiatic states are compelled to have recourse to Russia for the precious metals of which they stand in need. The total value of Russian goods now annually disposed of in Central Asia does not exceed five millions roubles (£750,000,) and deducting that of the Kirghiz-steppe, the whole trade will not amount to more than two millions (£300,000.) The diet of the wandering tribes consists almost entirely of meat, milk, and cheese-curd; bread being very sparingly used, and confined to a few of the wealthiest chiefs. Russia has pushed forward her outposts to within 300 miles of the British frontier on the north. But there intervenes between the Russia in Asia and British India, the mighty barriers of the Hindoo Koosh, and the Kuen Lun, which rise like a wall, 17,000 feet high, with scarcely a crest or depression throughout their entire extent—none certainly practicable for an army with the material and appliances of war as waged by the 19th century civilization. The settlement of the Amoor was effected in much the same manner as Mahommed Toghluk once attempted to transfer the population of Delhi to Dowlatabad in the Deccan, but with a more successful issue. Whole colonies of Cossacks, men, women, children and household gods were moved from their homes and settled at distances varying from 100 to 50 miles. The settlements are placed from ten to thirty miles apart, with a view to affording convenient coaling depots for steamers rather than to the suitability of the soil or locality for settlers. The houses are arranged with military precision. Some of the villages have been accidentally settled in fine agricultural districts and magnificent grain crops are raised. So successful have the settlers proved in growing grain, that Government consider that the local supply will equal the demand for naval and military purposes. In 1866 there were twenty-two steamboats in actual service, and two or three new ones nearly ready. In A. D. 1870 the settlements include a population of about forty thousand, of which one-eighth is at Nicolayevsk, the oldest and most important town; valuable forests are there of cork, mahogany, birch, pine, spruce and elm with masses of vines and thick underwood, but seem to possess greater attractions for the hunter than the woodsman. A species of tiger, is often met with even as far north as 53° North latitude.

Deer and other four footed game are also found in great abundance. *Russians in Central Asia*, Capt. Valikhanof, M. Venkoff, pp. 397, 402, 403, 456, 458, 484. J. R. Michell, p. 4. See as Bokhara, India Kalka; Pekin; Oxus.

RUSSIA LEATHER.

Cuir de Russie... ..FR.	Jahta..... ..POL.

Cuojo di Russia	

The tanned hides of oxen, manufactured in a peculiar manner. The leather is soft, has a strongly prominent grain, a great deal of lustre, and a powerful and peculiar odour. The colours are principally red or black; the former is much esteemed for binding books, and making articles where a fine durable leather is required, the latter is chiefly in demand in Russia for shoe and boot making.

Russia leather occasionally comes to Peshawur. Another kind of leather having a metallic lustre, called "kimsana;" is imported also from the north-west; also a beautiful leather, used in the manufacture of the bright blue green shoes from Kashmir and Peshawur, which is called "kimakht." This is not made in the Punjab. Peshawur sword scabbards are often covered with a black leather, looking like morocco, it is probably an imitation. Russia leather is said to be made of horse's skin, it is thick but pliant, and of most grateful fragrance. The skins are much valued for the preservation of merchandize, as insects will not attack them. —Faulkner.

RUTH or Rat'ha. HIND. A car from which no doubt has been derived the word chariot, the rath is sometimes ornamented, its scarlet screens and canopy hung with fringes. —Tr. of Hind. Vol. II. p. 39.

RUTH SAPTAMI, from ratha, a car and saptami, the 7th day of the month, is dedicated by hindoos to the worship of the sun. This is held about the 11th February and is regarded as the beginning of the Manwantaram or period embracing the age of Manu. The Holi or Hutasnvi festival, in Sanscrit Holikha or Phal gotsava, is called also dola or dolavatra, the swinging festival, and supposed to relate to the vernal equinox and to be similar to the Persian New year. It is held about the 19th March, or 15 days before the full moon of Phalgun. It is in honor of Krishna and is quite a saturnalia, red powders are thrown and red fluids squirted at passers by and licentious songs sung. At the close of the festival, a pile is lighted, and a wheaten cake or poli, offered on it.

RUTHOG. See Kailas or Gangri Rang. Shawl-goat.

RUTICILLA ERYTHROGASTRA, Gould R. Tricolor, Gould. A specimen of this fine and very rare Himalayan bird was obtained at the side of a mountain stream near Landour, — there were a pair of them, apparently alike in colour.

RUTICILLA PHŒNICURUS or Phœnicura ruticilla, the Redstart of Europe, West Asia, Siberia (Schlegel), Japan,

(Temminck,) and N. Africa ; it is migratory, replaced in Sindh and Afghanistan by *R. phœnicuroides*, which is probably the *R. phœnicurus* noted from Nepal. There are numerous Himalayan species ; and one *R. rufiventris* is generally diffused over India.

RUT JUGGA. HIND. Nocturnal vigils, a mahomedan ceremonial on several occasions. —*Herkl.*

RUTNAGHERRY, in lat. $16^{\circ} 18' N.$, and long. $87^{\circ} E.$, is a straggling open town 160 miles S. of Bombay. Rutnagherry, on the Konkan coast, in lat. $16^{\circ} 59' N.$, long. $78^{\circ} 15\frac{1}{2}' E.$, is a fortified neck of land, on the south side of which is a large bay into which a river disembogues.

RUTNAB, a river near Najibabad in Bijnur.

RYHAN. See *Tasbeeh*.

RYOT. AR. HIND. PERS. A cultivator, a client, subject, but is more especially applied to the agricultural population.

RYOTWARI. A revenue term applied to the system under which the land taxes of the Madras Presidency are collected. In the Bengal Presidency during the administration of Lord Cornwallis, in the provinces of Bengal, Behar and Benares, the Government settled, permanently, the persons' names, and the amount of tax to be raised, solemnly engaging never to increase it. The persons thus raised to a social position similar to the landlords of Europe, were termed zemindars. There is no doubt that many of them were persons of hereditary influence and status in the country, and that their connection with the land, of which they were then recognized as the proprietors, had in general been of a permanent character. But their position, nevertheless, was essentially that of middle-men ; collecting the revenue, not for themselves, but for the Mogul government ; accounting to that government for their receipts, and remunerated by a per centage of the collections. It is now, however, universally admitted that they never had the power of disposing arbitrarily of the land. There were, everywhere, at least large classes of tenants, whom they could not lawfully eject, except for non-payment of revenue, and from whom they could not lawfully exact more than the customary payments. The ryotwar system of Madras was principally followed out by Colonel Reade and Sir Thomas Munro. Under this system, the peasant himself, the cultivator or farmer, is regarded as the proprietor of the soil, subject to the payment of the Government demand. The position which the Madras ryot holds is somewhat similar to that of the fiefholders of Scotland, whose feu is held in perpetuity, subject to a permanent feu duty ; with this difference that in Scotland, the rent, or tax, or feu is permanent or for a long lease of 999 years, but in Madras, the amount charged is settled annually. And this has given rise to the term annual settlements in Madras, as the system introduced by Lord Cornwallis has been named permanent settlements, the latter, leaving the farmer entirely at the mercy of the landlord. The Madras ryot can increase or diminish his holding annually ; and has thus all the benefits of a perpetual lease, without its responsibilities, inasmuch as he can at any time, throw up his lands, but he cannot be ejected so long as he pays his dues. He also receives assistance by remission of assessment, in unfavourable seasons. The practical disadvantages of the ryotwar system consist in the annual mod-

King and Government. For valuation of cultivated lands. The great bulk of the revenues, and as the taxes of a country must ever be regulated by the wants of the state, the annual collection affords the best opportunity for realizing monies for state purposes. In the North Western Provinces, the lands were acquired principally in consequence of Lord Wellesley's Mahratta wars, but the settlement of their land revenues was commenced and completed between 1834 and 1844, principally by Mr. Robert Mertens Bird. It is called the village system or settlement, and has been acted on, in the belief that the village community consist of the descendants or representatives of those by whom the village was, at some remote time, conquered or reclaimed from waste. In most cases, these are a part, and in some, form the whole of the agricultural population of the village; but the ordinary peasants or cultivators are descendants of persons who have settled in the village with the permission of the proprietors. But some of them have by grant or prescription acquired a fixity of tenure, while others have remained tenants at will. The village proprietors formed prescriptively, the municipal government of the village; a fact of great importance, village government being the only institution properly so called, which the hindus possessed. The time occupied in thus settling the North Western Provinces was about ten years, and the expense incurred in it was upwards of £500,000. It comprehended a detailed survey of a country about 72,000 square miles in extent, containing a population of more than 23,000,000, producing a land revenue exceeding £4,000,000. The proprietary rights as ascertained and recorded at the survey, were confirmed in perpetuity; but the Government assessment was fixed for twenty, and in some cases for thirty years. The Punjab settlement was on leases for terms of years, usually shorter than in the N. W. Provinces, and the cess does not exceed one-fifth of the gross value of the produce in rich tracts, and one-sixth or one-eighth or even less in poor. In the Bombay Presidency, the Madras ryotwar system was introduced after the Mahratta wars terminating in 1818, but since the recent survey, the land, cultivated and waste together, is divided into fields of an extent cultivable by one yoke of bullock, and on each field the Government demand is fixed for a period of years, at a very moderate rate. While the contract is binding on the Government, the ryot, on his side, can throw up his engagement at pleasure, and he is not required to pay the assessment for any year, on any field which he has not cultivated

or undertaken to cultivate in that year. In the Madras Presidency, a great improvement was introduced in the year 1837, by ruling that the land tax should not be increased, because on such land a more valuable article was cultivated, and in 1855, an entire revision of the Madras cess was undertaken and carried out during the administration of Lord Harris. Nearly two-thirds of the revenue of India consist of the rent, or cess, or tax on land, the second in amount is from opium, a third is from salt. The land in the South of India, belongs firstly to the family, secondly to the village community.

Joseph bought up the whole land of Lower Egypt for the king; every man sold his field; and the whole soil, except that which belonged to the priests, into which class he had himself been adopted by marriage, then became the property of the crown. He then made a new division of the land, allotted out the estates to the husbandmen to cultivate; and gave them seed to plant, and required them for the future to pay one-fifth part of the crop, as a rent, to the royal treasury. Thus did the Asiatic minister, copying the customs of the east, make the king the landlord of the whole country except the estates of the priests; and the land was then held by what is now known in Asia as the Ryot tenure. In Asia, generally, the landholders are tenant proprietors at a changeable rack-rent of about one-half of the crop; whereas the Egyptians paid a fixed and low rent of one-fifth. The Egyptian landholder was therefore rich enough to have peasants or slaves under him, while the Indian ryot is himself the peasant-proprietor. This rent was in the place of all direct taxes.

Throughout the Boondi territory, by far the greater part of the land is the absolute property of the cultivating ryot, who can sell or mortgage it. There is a curious tradition that this right was obtained by one of the ancient princes making a general sale of the crown land, reserving only the tax. In Boondi, if a ryot become unable, from pecuniary wants or otherwise, to cultivate his lands, he lets them; and custom has established four annas per beega of irrigated land, and two annas for gorma, that dependant on the heavens, or a share of the produce in a similar proportion, as his right. If in exile, from whatever cause, he can assign this share to trustees; and, the more strongly to mark his inalienable right in such a case, the trustees reserve on his account two seers on every maund of produce, which is emphatically termed "huk bapota ca bhom," the "dues of the patrimonial soil."—*Tod's Rajasthan, Vol. II.*
